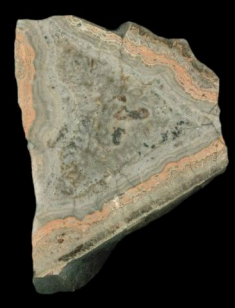
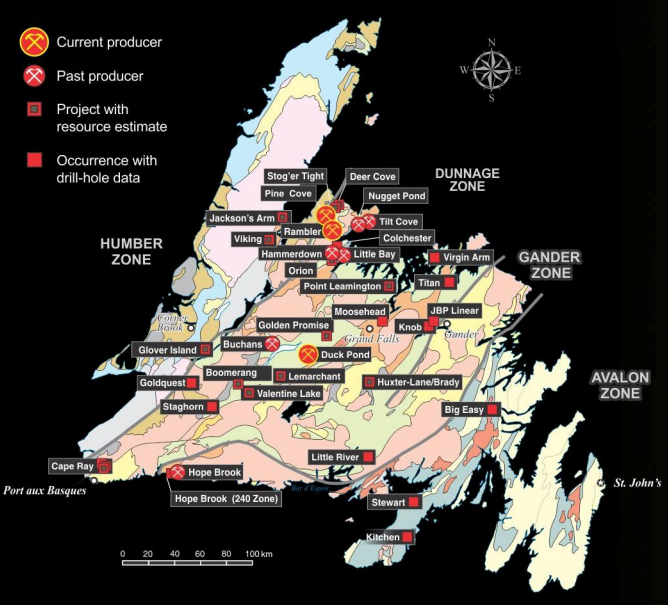
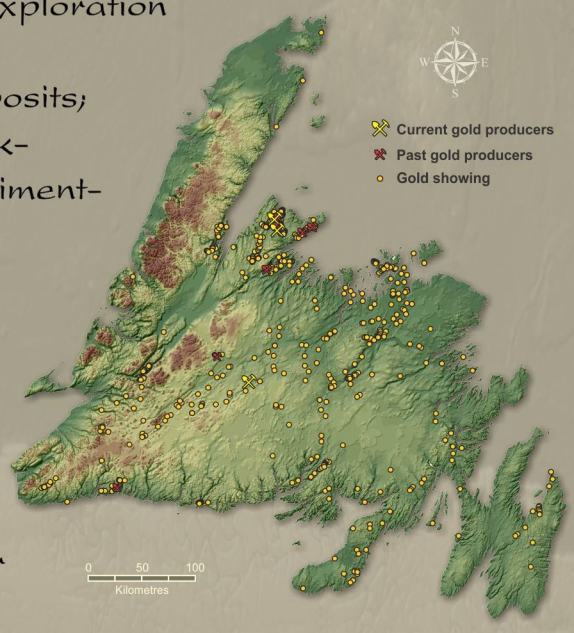
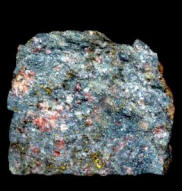
GOLD in Newfoundland





The Island of Newfoundland represents an emerging, under-explored gold district.




- First focused exploration for gold in early 1980's
- Previous production from epithermal (Au-Cu) and orogenic (Au-only) deposits, and as byproduct of VMS operations
- Current production from orogenic and VMS deposits; advanced projects targeting similar styles of deposits
- Advance and greenfields exploration programs for high- and low sulphidation epithermal deposits; other projects targeting bulk-tonnage, intrusion- and sediment-hosted deposits
- Recent option and joint-venture agreements, and claim-staking indicate renewed interest in these under-explored terranes.
- Properties are available for option or joint venture.
