**THM Average in Red** - THM Average exceeds the recommended national guideline of 100 µg/l running annual average.

**THM Average in Green** - THM Average is less than the recommended national guideline of 100 µg/l running annual average.

**THM Average in Black** - Data is not available for all of the past 4 quarterly sampling periods therefore can not compare to the recommended national guideline of 100 µg/l running annual average.

Notes: As of September 30, 2005 THM Averages are based on only the past 4 quarterly sampling periods (1 year) from the most recent sample.

µg/l - All THMs values are reported in micrograms per litre (µg/l) which is the same as parts per billion.

Running Annual Average - Data is available for all of the past 4 quarterly sampling periods. Running Annual averages are directly comparable with the national guideline of 100 µg/l.

Simple Average - Data is not available for all of the past 4 quarterly sampling periods. This data cannot be compared to the recommended limit. A minimum of four samples per year, one in each season, are required to determine if a particular water supply meets or exceeds the recommended limit

Total Number of Samples - The number of individual samples that were collected and analysed. Communities with no samples are not included on this list. These communities generally do not have an operational disinfection (chlorination) system.

Quality Assurance / Quality Control (QA/QC) - The department is striving to improve the quality of the data using standard QA/QC protocols. This is an evolving process which may result in minor changes to the reported data.

Detection Limit - Analytical results less than the detection limit have been reported as zero. If you wish to know the detection limit of a particular parameter, please refer to the detection limit table available on the web page.
