

Figure 6-8, Pond 6

6.3.7 Pond 7 (2007)

Pond 7 (Figure 6-10) is located approximately 200 m northeast of Pond 6 and lies on the southeast boundary of the Project footprint. Pond 6 drains into Pond 7 which outflows north to Pond 1. The total area of Pond 7 measured 12,492.06 m^2 and the deepest location measured was 0.65 m deep. The substrate was comprised mostly of muck with aquatic vegetation. Two single bag fyke nets and two minnow traps were set throughout the pond and fished for approximately 18 hrs over night. A total of 38 three spine stickleback and 1 Atlantic salmon were caught, weighed, measured and then released back into the pond.

Figure 6-9, Pond 7

Habitat Quantification

A DFO generated spreadsheet was used for habitat quantification, the spreadsheet was used in conjunction with the habitat data collected in the field and the species presence data. Table 6-34 presents an overview of the habitat information used to determine habitat areas. Table 6-35 shows the habitat suitabilities of each habitat type for the species present, i.e., brook trout, Atlantic salmon and threespine stickleback. DFO spreadsheet calculations were used to determine the final habitat equivalent units of each habitat type present (Table 6-36). The pond is part of the Watson Brook drainage basin, which is known to support Atlantic salmon, brook trout and stickleback. Therefore total HEU's (Table 6-36) have been calculated for Atlantic salmon, brook trout and threespine stickleback and were 0.29 ha, 0.92 ha and 1.24 ha respectively.

6.3.8 Pond 8 (2007)

Pond 8 (Figure 6-11) is located approximately 300 m northwest of Pond 1, into which it outflows. The total area of Pond 8 measured 57,804.68 m² and had an average depth of 0.63 m, the deepest location measured 0.90 m deep. The shoreline substrate was comprised primarily of cobble, gravel and muck; while the remainder of the littoral zone was muck with aquatic vegetation.

Two single bag fyke nets and two minnow traps were set throughout the pond for two sets. The first set averaged 18 hours over night and yielded a total of 14 brook trout and 55 three spine sticklebacks. The second set averaged 123 hours (6 nights) and yielded a total of 41 brook trout (two of which where recaptures), 26 three spine sticklebacks and 1 juvenile Atlantic salmon.

The pond's inflow was located on the north side while the outflow was on the south side and drained into Pond 1. A secondary outflow located on the southwest side of the pond drained west into Pond 10.

Figure 6-10, Pond 8

Habitat Quantification

A DFO generated spreadsheet was used for habitat quantification, the spreadsheet was used in conjunction with the habitat and species data collected in the field. Table 6-37 presents an overview of the habitat information used to determine habitat areas. Table 6-38 shows the habitat suitabilities of each habitat type for the species present, i.e., brook trout, Atlantic salmon and threespine stickleback. DFO spreadsheet calculations were used to determine final habitat equivalent units of each habitat type present (Table 6-39). The pond is part of the Watson Brook drainage basin, which is known to support Atlantic salmon, brook trout and stickleback. Therefore total HEU's (Table 6-38) have been calculated for Atlantic salmon, brook trout and threespine stickleback and were 0.10 ha, 3.91ha and 5.75 ha respectively.

6.3.9 Pond 9 (2007)

Pond 9 (Figure 6-12) is located approximately 200 m north of Pond 8, within the northeast section of the Project footprint. Substrate throughout the pond consisted mostly of aquatic vegetation (grass/sedges) and the shoreline substrate comprised of cobble and gravel. There was no visible inflow and the outflow was well defined for approximately 15 m and then splayed over grasses (overland flow) and bog.

Pond 9 had a total area of $3,573.15 \text{ m}^2$ and the deepest location in the pond measured 0.6 m. Emergent vegetation was visible throughout the pond with exception to the areas that measured 0.6 m deep.

One double bag fyke net and one minnow trap were set in the pond for a 17 hour, overnight set. Neither the minnow trap nor the fyke net yielded any fish; there were however tadpoles and water beetles caught in the fyke net. The pond is not considered fish habitat.

Figure 6-11, Pond 9

6.3.10 Pond 10 (2007)

Pond 10 (Figure 6-13) is located approximately 200 m south of Pond 9. The outflow is on the southeast side of the pond and provides some drainage into Pond 8. The pond was shallow throughout, approximately 0.35 m or less, with emergent vegetation visible over most of the pond. The total area of the pond was calculated to be $3,677.36 \text{ m}^2$.

Fish sampling gear was not set in the pond due to shallow water levels. The pond is not considered to contain fish habitat.
