263 Earth known as the World Geodetic System 1984 (WGS-84). Other local
264 models may be in use, and their selection in CALMET will make its output
265 consistent with local mapping products. The list of Datum-Regions with
266 official transformation parameters is provided by the National Imagery and
267 Mapping Agency (NIMA).

373 Sigma-y is adjusted by the factor (AVET/PGTIME)**0.2 to either
374 decrease it if the averaging time selected is less than the base
375 averaging time, or increase it if the averaging time is greater.
376 The base averaging time is denoted as PGTIME due to historical
377 reasons as this adjustment was originally applied to the PG sigma
378 option. It is now applied to all dispersion options.
379 The factor is applied to the ambient turbulence sigma-v (m/s) and
380 does not alter buoyancy enhancement or far-field Heffter growth.

660      Analyses of fogging and icing impacts due to emissions from
661      arrays of mechanically-forced cooling towers can be performed
662      using CALPUFF in conjunction with a cooling tower emissions
663      processor (CTEMISS) and its associated postprocessors. Hourly
664      emissions of water vapor and temperature from each cooling tower
665      cell are computed for the current cell configuration and ambient
666      conditions by CTEMISS. CALPUFF models the dispersion of these

820 Datum-region

821 -----

822

823 The Datum-Region for the coordinates is identified by a character
824 string. Many mapping products currently available use the model of the
825 Earth known as the World Geodetic System 1984 (WGS-84). Other local
826 models may be in use, and their selection in CALMET will make its output
827 consistent with local mapping products. The list of Datum-Regions with
828 official transformation parameters is provided by the National Imagery and
829 Mapping Agency (NIMA).

2242
2243 Emissions from roads are generated from individual line segments defined
2244 by a sequence of coordinates provided for each road-link. Each link
2245 is entered as a discrete source and is defined as a section of the road
2246 for which emissions are uniform.
2247
2248 A long, winding isolated road might be characterized by a single link made
2249 up of many coordinate triples (x,y,z) that describe its pathway. These
2250 points should be sufficient to resolve curves, but need not have uniform
2251 spacing. For example, a straight flat segment can be defined by 2 points,
2252 regardless of the distance covered. Long line segments are automatically
2253 divided further within the model into segments that are limited by the
2254 grid-cell boundaries (no segment may extend across multiple cells).
2255 One emission rate (g/m/s) for each species is used for the entire road.
2256
2257 Near a congested intersection, many short links may be required to resolve
2258 the spatial and temporal distribution of emissions. Each is entered and

2394 do not need to include specific source or species names used in the simulation,

a

Data for each receptor are treated as a separate input subgroup and therefore must end with an input group terminator.

13090

b

Receptor height above ground is optional. If no value is entered, the receptor is placed on the ground.

13093

c

Receptors can be assigned using group names provided in 20b. If no group names are used (NRGRP=0) then the default assignment name X must be used.
