

Executive Summary

This report presents the results of the Newfoundland Environment Precipitation Monitoring Network (NEPMoN) program for the period 1999 to 2000. During this period there were 6 operational acid rain sites.

In 1999 the acid rain network consisted of sites at Burgeo, Cormack, Loch Leven, Salmonier, Wooddale and Terra Nova. The site in Burgeo was closed in September, 2000 due to proximity to the federally operated site in Bay D'Espoir.

Each site is equipped with an automated precipitation sampler which collects wet deposition (i.e. rain, snow, hail etc.). Once a week an operator removes the collected precipitation from the sampler, weighs it and transfers a sample to a labelled polyethylene bottle for storage at 4 °C. Samples were analysed for a selection of parameters at Environment Canada's Environmental Quality Laboratory in St. John's up to the end of August 2000 and subsequently at Environment Canada's Environmental Quality Laboratory in Moncton, New Brunswick.

Site performance measures and overall data quality evaluations are provided for each site over most of the last decade. The Cormack, Wooddale and Terra Nova B sites have performed very consistently, producing good quality data. The performance of other sites has been somewhat erratic producing data that varied from good to "unacceptable for trend monitoring". A noted weakness with the sites has been the measurement of the precipitation. The Belfort rain gauges have given erratic results, particularly during winter. These Belfort gauges were replaced with standard rain and snow gauges in the fall of 2000 which are consistent with the Canadian Air and Precipitation Monitoring Network (CAPMoN).

The results from the various sites show a pronounced spatial variation in the deposition of sulphates and nitrates across the island. The largest depositions occur on the southwest corner of the island, with the quantity diminishing as one progresses to the north and to the east. There are indications that the rate of deposition of sulphate has been diminishing steadily over the last decade but the rate of deposition of nitrate has increased. It is difficult to say whether these trends have any relationship to emission abatement measures, or if they result from changes in weather patterns. These questions can only be answered in the context of a continued continental-wide monitoring program.

Since 1998, NEPMoN was able to continue operation and increase its number of monitoring sites through the generous financial contributions from industries in this province. Newfoundland and Labrador Department of Environment would like to thank the following companies for their valuable contributions.

North Atlantic Refining Limited
Newfoundland Hydro
Voisey's Bay Nickel Company Limited
Iron Ore Company of Canada
Wabush Mines
Corner Brook Pulp and Paper Mill
Abitibi-Consolidated Stephenville
Abitibi-Consolidated Grand Falls

Newfoundland Environment Precipitation Monitoring Network (NEPMoN)

Mission Statement:

To determine the spatial and temporal variations in the long range transport of acidic pollutants into this province.

Objectives:

- (i) To ensure wet sulphate and nitrate deposition trends are monitored and evaluated according to the protocols of the Canadian Air and Precipitation Monitoring Network (CAPMoN).
- (ii) To ensure that a comprehensive, and integrated, sulphate and nitrate deposition monitoring and analysis program is continued in the Province of Newfoundland.
- (iii) To monitor other components of acid deposition which may have an impact on the Newfoundland and Labrador environment.
- (iv) To assist in any research efforts designed to obtain a better understanding of the effects of acid rain.
- (v) To provide reliable data to the National Atmospheric Chemistry (NATChem) Database and Analysis System.

The Network.

The network consists of a number of wet-only precipitation collectors located at sites around the island which have been specially selected to be representative of different regions (see Appendix B). Sampling sites are located strategically throughout the island portion of the Province so that a better estimate of the depositional loading pattern of sulphates and nitrates could be obtained. The number of sites reached a maximum in 1995 when seven collectors were in operation. Due to lack of funding, this number was reduced to two in 1996, but with generous financial support from provincial industries, the number was increased back up to six collectors during January, 2000. June, 2000 the Burgeo site was closed reducing the number of operational sites to 5. Site operators record the occurrence and type of precipitation on a daily basis, and collect the precipitation samples weekly. Individual site history sheets are provided in Appendix A. These include measures of the site's performance (see Appendix C). Figure 1 shows site locations.

Chemical Analysis

Environment Canada assists the Department to meet the program objectives by performing free chemical analysis for acid precipitation samples. The parameters measured are as follows:

Table 1

Parameter	Technique	MDL Value
pH	Electrometric	0.01
Conductivity	Conductivity Meter	0.1 µS/cm
SO ₄ ²⁻	Ion Chromatography	0.02 mg/L
NO ₃ ⁻ -N	Ion Chromatography	0.008 mg/L
Cl ⁻	Ion Chromatography	0.02 mg/L
NH ₄ ⁺ -N	Auto Analyzer Ion Chromatography	0.009 mg/L 0.03 mg/L
Na ⁺	Atomic Absorption Ion Chromatography	0.02 mg/L 0.04 mg/L
Ca ²⁺	Atomic Absorption Ion Chromatography	0.06 mg/L 0.07 mg/L
Mg ²⁺	Atomic Absorption Ion Chromatography	0.002 mg/L 0.04 mg/L
K ⁺	Atomic Absorption Ion Chromatography	0.02 mg/L 0.03 mg/L
Alkalinity	Gran Titration	0.2 mg/L

MDL = Method Detection Limit

The use of ion chromatography for the determination of cations is a fairly recent introduction. The precision of the method compares quite favorably with that obtained by other techniques, and the results are more than adequate for our purposes.

A minimum of 60 mL of sample is required to do all the chemical parameters at least once. If the sample volume is less than 60 mL the analyses are done in the following order until the sample is

depleted: - SO_4^{2-} , NO_3^- -N, Cl: Na^+ , K^+ , Mg^{2+} , Ca^{2+} , NH_4^+ -N, pH, alkalinity, and conductivity. It has been noted that small samples usually have a high concentration of analytes, so these samples can be diluted before being run on the ion chromatograph. This means that the cation and anion contents can be determined on very small samples.

Evaluation of Data Quality

It is very easy for contamination to occur at any stage of the process, and a rigorous quality control procedure is followed to screen out any samples which could bias the results.

Operators are requested to comment on any unusual occurrence, such as the presence of extraneous material in the sample and on the performance of the collector.

Laboratory analysis follows standardized procedures that satisfy the requirements of the Canadian Association of Environmental Analytical Laboratories (CAEAL). These procedures include the use of Certified Reference Materials (CRMs), and repeatability verification. Once all the chemical parameters have been measured, an ionic balance is generated to verify that the anionic and cationic components are in equilibrium. Any samples falling outside experimental error tolerance levels are re-analyzed.

The final laboratory results for the individual samples are merged with the respective weekly rainfall collection data to give a spreadsheet file which is screened once more for outliers before the calculation of summary statistics for the year. This process is described in greater detail in Appendix E. The weekly rainfall collection statistics and the ion concentrations are published as separate tables. The annual statistics are collected onto a third report form. The latter are examined graphically to identify any trends within the data.

Results and discussion

In general the collection sites operated well over the last two years. The main concern with the system involved the rain gauge measurements. The Belfort rain gauges at the Loch Leven and Terra Nova sites have provided readings that did not correlate well with the collector data. These gauges have been replaced with standard rain and snow gauges which have been working well. Due to unacceptably high error in the results from the Belfort rain gauges at the Terra Nova and Loch Leven sites, data from these rain gauge measurements were discarded as erroneous. With the exception of Cormack, all precipitation data was obtained from co-located or nearby climate stations. Cormack had standard rain and snow gauges in place for the 1999 and 2000 calendar years and the data from these gauges is being used. There have also been some data issues with the change in laboratories used for the chemical analysis. Some data had been delayed due to the Moncton laboratory changing its LIMS (Laboratory Information Management System). All issues with this LIMS and the laboratory in general have been resolved.

Graphical display of the annual depositions at the different collector sites is restricted to the ones of greatest interest:

Excess Sulphate Deposition (Kg per hectare per year);
Nitrate Deposition (Kg per hectare per year);
pH;
Annual Rainfall.

Highlights of 1999 - 2000 NEPMoN Data with Sulphate

- There appears to be no concrete increase or decrease in the deposition of excess sulphate over the Province, with the exception of Loch Leven.
- The excess sulphate deposition for Wooddale, Cormack and Burgeo has increased slightly, but this is consistent with the increase in precipitation recorded during the period.
- Terra nova B has seen a slight decrease in the excess sulphate deposition.
- The Wooddale and Terra Nova B sites are below the 8 Kg/ha/year critical load limit.
- Loch Leven has seen a major increase in excess sulphate deposition between the 1999 and 2000 calendar years, almost doubling in deposition.

Highlights of 1999 - 2000 NEPMoN Data with Nitrate and pH

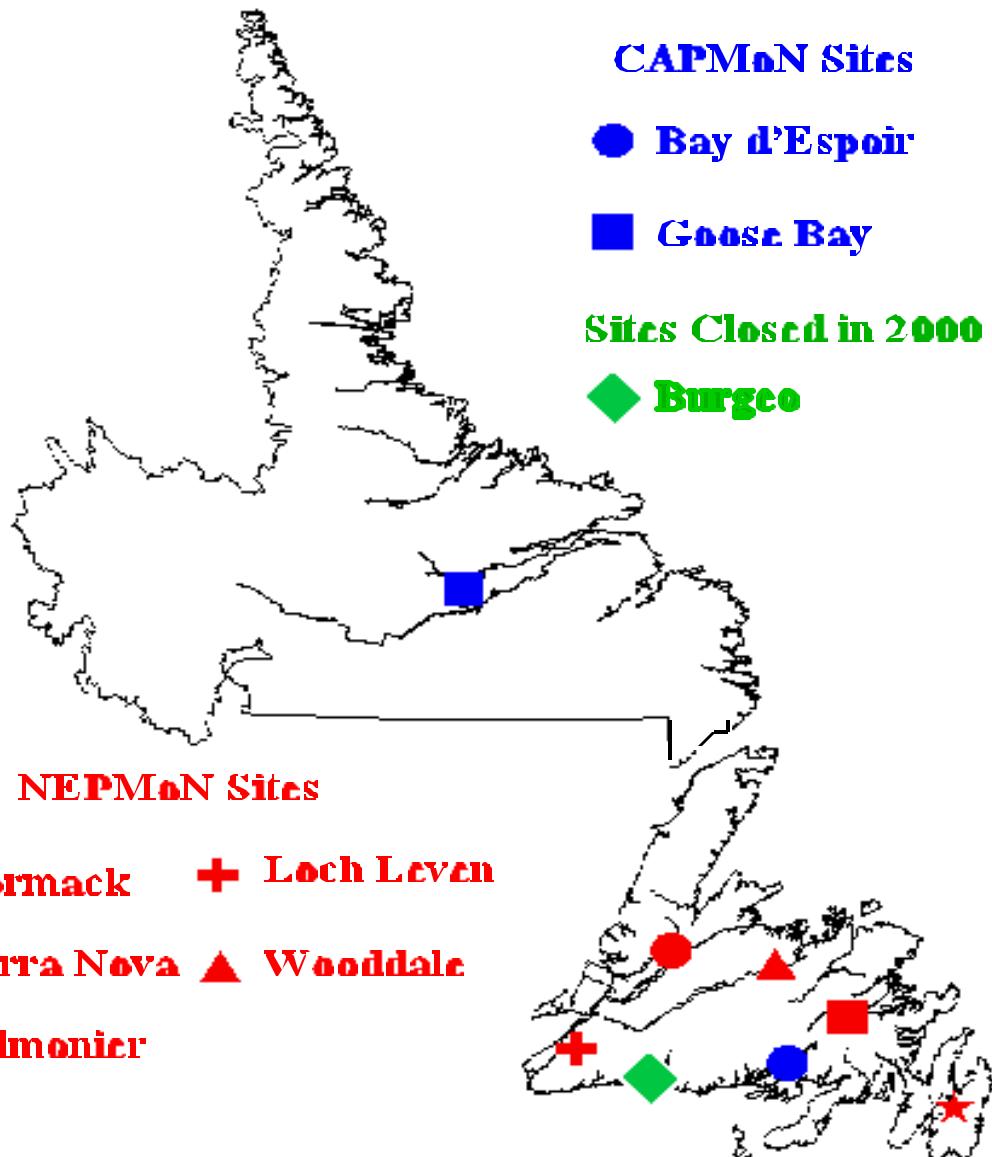

- Nitrate deposition has increased slightly over this time period.
- The pH values of the precipitation show signs of having reached a minimum, and are now increasing again, with the exception of Loch Leven. In other words, the rain is becoming less acidic.
- The 2000 calendar year for Loch Leven shows a decrease in pH (meaning an increase in acidity), which seems to be consistent with the increase in excess sulphate deposition for that time period and location.

Note: Given that the spatial distribution of deposition indicates that the greatest quantities fall onto the south-west corner of the island, it is clear that the major sources of pollution lie outside the province. This means that efforts to reduce acid precipitation will be dependant on the actions of other agencies. The data that NEPMoN supplies to the Meteorological Service of Canada is used to monitor actions taken in other parts of the continent. In other words, the onus is on the Department to follow nationally approved protocols. Generally speaking, the Department's protocols are compatible with CAPMoN standards.

Conclusion

In general there appears to be no significant changes in the deposition of sulphate and nitrate loadings to this Province during 1999 - 2000. Some areas have received an increase in excess sulphate deposition whereas other areas have received a decrease in excess sulphate deposition. Based on these results, further reductions are required to achieve the 8 kg/ha/yr critical loading necessary for the sensitive parts of the province. Nitrate deposition has increased at nearly all sites. It is important that the monitoring program be continued and improved in order to ensure that emission abatement projects continue to receive attention.

Acid Rain Sites Newfoundland and Labrador 2000

NB: The Salmonier site reopened in 1999, principally to assist in a research project monitoring the Salmonier River basin. The Burgeo site was closed in 2000 due to latitudinal redundancy with the federally operated site in Bay d'Espoir.

1999 - 2000 Precipitation Chemistry Listings

The 1999 - 2000 precipitation chemistry listings are presented in the following order:

- (a) Rain Collection Statistics (daily basis);
- (b) Ion Concentrations Table (weekly basis);
- (c) Deposition and Annual Summary Table.

Burgeo

Cormack

Loch Leven

Terra Nova B

Wooddale Tree Nursery

Salmonier Nature Park

An explanation of the terms and abbreviations used in the following tables is given in Appendix D. The data validity flags used by NEPMoN are defined in Appendix F.

APPENDIX A

Acid Precipitation Collection Sites

Location:

Sites are located according to a set of criteria originally developed by the Canadian Air and Precipitation Monitoring Network (CAPMoN) (see Appendix B). Each site is rated as to how well it meets these criteria and is assigned a Site Representativeness Level which is used to assess the overall data quality level. Individual site characteristics are given below.

Equipment:

a) Precipitation Collectors

Precipitation samples are collected using an automated, wet-only precipitation collector. Two types of collectors were used in the years 1999 -2000 - the M.I.C. Type AU collector and its successor the M.I.C. Type AUC collector.

These collectors have four major components: (1) two heated sensor boards which detect the occurrence of precipitation, (2) a bucket to collect the precipitation, (3) a moveable roof which uncovers the bucket when activated by the sensors during precipitation, and (4) a housing which contains the electronic control circuitry and motor. The Type AUC collector features improvements to the electronic circuitry, but is otherwise identical to the Type AU machine.

At each of the sites plastic bags are used to line the collection bucket. These bags are made of a 3 mil CIL virgin polyethylene inner film and a 0.48 mil CIL polyester outer film. The two films are laminated together using an alcohol primer.

b) Rain Gauges:

The Belfort rain gauges were removed from Terra Nova and Loch Leven in the fall of 2000. Since that time, all sites, with the exception of Salmonier, have Type B rain gauges and nipher shielded snow gauges.

c) Balances

Balances are used at all sites. The balance is used to weigh the amount of precipitation collected, so that the volume can be calculated. Given the bucket orifice area, a sample depth can be calculated for comparison to the measured gauge depth.

d) Dustbuster

A dustbuster is used to aid in securely seating the bag in the bucket by removing the air trapped between the bag and bucket.

Protocol:

The sample collection and handling procedures are covered by the “Field Operators Manual - Newfoundland Environment Precipitation Monitoring Network - Revised 1995.”

In brief, a sample is collected once a week at a set time. Inside the sample handling area, a new sample bag is placed inside the spare bucket. The bucket is weighed and the mass recorded. A lid is placed on the bucket, and the covered bucket is taken to the collector where the fresh bucket is exchanged with the one on the collector. The bucket and sample are covered with the lid to protect the sample from contamination. The sample bucket is then taken back to the sample handling area where the bucket and sample are weighed and the mass recorded on the operator worksheet. A clean 250mL polyethylene bottle is filled from the sample and any excess discarded. The stoppered bottle is stored on site at 4°C until collected during a quarterly maintenance visit by a member of the department. Where the site is remote, the sample is mailed into the department (eg: Burgeo). As well as collecting the sample, the operator is required to log daily observations of the occurrence of precipitation on the worksheet.

Individual Site Characteristics: Bay D'Espoir

Latitude: 47°59'32" N Longitude: 55°49'02" W
 UTM (N): 5315900 m UTM (E): 588250 m
 Elevation: 168 m
 (Relocated 1km from original site: Sept 27/89)

Site Representative Rating: 1
 Deviations from Siting Criteria:
 2 - less than 40km to open seawater.

First Opened: 1983 02

Closed: 1996 05

Equipment:

Collector: Type A (1983 03) replaced by Type AU (1989 06)
 Rain Gauge: Type B (1983)
 Snow Gauge: Nipher (1983)
 Bags: First used 1989 06
 Balance: First used 1987 01
 Dustbuster: First used 1989 06

APPENDIX B

Network Siting Criteria

The quality of the data obtained from the acid precipitation program varies from site to site. A major factor in assessing the overall data quality is the site representativeness ranking, which estimates the extent to which precipitation collected in that location typifies precipitation in that area of the province. The Newfoundland Department of Environment and Labour has adopted the Canadian Air and Precipitation Monitoring Network (CAPMoN) siting criteria. The site representative ranking is determined by just how well the location is judged to meet the siting criteria listed in Table B.1.

Table B1 Siting Criteria

Newfoundland Department of Environment Ideal Acid Rain Siting Criteria	
1	No continuous single point source or area source of emissions greater than 10,000 t/y SO ₂ or NO _x should exist within 50 km of the site.
2	Sites should be located 40 to 50 km from the shoreline of salt water bodies.
3	Sites should be located no closer than 5 km from the edge of small villages (population less than 5,000), 10 km from the edge of towns (population less than 10,000), and 40 km from the edge of cities.
4	Within 500 m of the site, there should be (a) no moving sources of pollution such as air, water and surface transportation; (b) no surface storage of pollutants (e.g. salt piles); (c) no wind activated sources of pollution such as exposed soil and (d) no intensive agricultural activity.
5	On-site obstructions (e.g. trees, towers, poles) should be located at least 2.5 times their height away from the precipitation collector.
6	On site buildings should be located at least 4 to 5 times their height away from the sampler.
7	The site should be flat, grass or moss covered and surrounded by trees.
8	The site should be sheltered from roads and fields by rows of trees.

Note The site must be near a 120 volt AC source and easily accessible to the operator at least on a weekly basis.

Site Representativeness Ranking

The CAPMoN siting criteria were established with the objective of selecting sites that would map the spatial distribution of pollutants across Canada in an unbiased manner. An evaluation of how well each site meets the siting criteria is obviously a measure of the quality of the data produced by the collector and is defined as the site representativeness. This measure is divided into four levels as defined in Table B.2. The determination of site representativeness level often requires a judgement call on the part of the network manager.

Table B.2

Site Representativeness Level	Definition
<u>1</u> Regionally Representative	site does not deviate seriously from the siting criteria.
<u>2a</u> Potentially Regionally Representative	site fails to meet one, or more, of the siting criteria but the local influences are judged to be small.
<u>2b</u> Potentially Regionally Unrepresentative	site fails to meet one, or more, of the siting criteria, but the local influences are judged not to be severe enough for the data to be considered Level 3.
<u>3</u> Regionally Unrepresentative	site is influenced significantly by local factors.

APPENDIX C

Data Completeness Statistics

Due to sampler malfunction or improper sampling procedures, some days are not represented in the data set. Six data completeness statistics are used to describe how effective the collection site was in generating valid data. These statistics are defined in Table C.1

Table C.1

Data Completeness Statistic	Definition
%PCL	<u>Percent coverage length</u> is the percent of the summary period for which information on whether or not precipitation occurred is available.
%TP	<u>Percent total precipitation</u> is the percent of the total precipitation depth measured during the sample period which is associated with valid samples.
%VSL	<u>Percent valid sample length</u> is the percentage of days during the summary period that are associated with valid sample periods. A valid sample period is ≥ 6 days and ≤ 8 days.
%VSMP	Percent of wet deposition samples that have <u>valid sample concentration measurements</u> .
%COLEFF	<u>Percent collection efficiency</u> is the ratio (converted to percent) of the total sample volume (converted to depth) to the total precipitation depth for qualifying samples, i.e. samples that have (a) a co-located standard gauge and sample volume measurement and (b) that have a valid sample concentration measurement.
%SEASALT	<u>Percent sea salt correction</u> is the percent of the average sulphate concentration that is estimated to have come from sea salt, using sodium as a tracer of sea salt.

Data Completeness Level

Each of the above statistics is assigned a rating between 1 and 4 depending on its value (see Table C.2). This rating is the data completeness level for that particular statistic. Level 1 has the highest degree of data completeness and provides the best information. Less confidence is placed in a data summary with a data completeness level of 2, and still less in level 3 data. Level 4 data summaries are seen as failing to provide adequately representative values for the particular summary period and are deemed to be of the lowest quality.

Table C.2

Data Completeness Statistic	Level 1	Level 2	Level 3	Level 4
%PLC				
Annual	\$95%	\$90%	\$90%	<90%
Each Quarter	\$75%	\$60%	\$50%	<50%
%TP,%VSL,%VSMP				
Annual	\$80%	\$70%	\$60%	<60%
Each quarter	\$70%	\$60%	\$50%	<50%
%COLEFF				
Annual	\$70%	\$40%	\$30%	<30%
Winter	\$50%	\$40%	\$30%	<30%
Spring,summer, autumn	\$80%	\$60%	\$60%	<60%
%SEASALT	#25%	#50%	#75%	>75%

Overall Data Quality Levels

An overall Data Quality rating for a particular summary period is obtained by merging the poorest of the six Data Completeness levels with the Site Representativeness ranking (see Table C.3). It should be noted that the Overall Data Quality rating cannot be better than the rating assigned to the Site Representativeness. Level 1 data meets the most rigorous screening criteria and is considered to be of the best quality and most suitable for model evaluation and trend analysis. Level 3 represents what is considered to be the minimum acceptable quality for model evaluation.

Table C.3 Overall Data Quality Levels

Site Representativeness Level	Annual Data Completeness Level			
	1	2	3	4
1	1	2	3	4
2a	2	2	3	4
2b	2	2	3	4
3	3	3	3	4

APPENDIX D

DATA LISTINGS

Explanation of terms - Weekly Rain Collection Statistics

- 1. SITE LOCATION:** Area where site is located
- 2. YEAR:** Sample Year covered by the listing.
- 3. SAMPLE ID:** A seven character label is used to identify uniquely a particular sample. The first two characters specify the acid rain site and the remaining five characters constitute the sample start date using the Julian dating system. Precipitation gauge samples will use the same numbering system:

94 = Loch Leven (active)
89 = Cormack (active)
10 = Burgeo (closed)
17 = Salmonier (reopened 1999 - active)
32 = Terra Nova B (active)
75 = Wooddale (active)
53= Red Bay (new - active)

- 4. START DATE:** The month and day on which sampling began.
- 5. END DATE:** The month and day on which sampling ended.
- 6. # DAYS:** The number of days from Start Date to End Date. Normally seven (7).
- 7. SMPL VOL :** The volume of the precipitation sample in mL as determined from the field weight. The field operator weighs the bucket with a bag in it before installing it on the collector. Then the bucket and bag with the sample are weighed after the bucket is changed at the end of the week. The difference between the two weights gives the weight of the sample collected. The volume is then calculated by the following formula:

$$SMPL\ VOL \cdot \frac{W}{\bar{n}} \quad (1)$$

Where ;

SMPL VOL = sample volume

W = weight of precipitation sample (g)

\bar{n} = density of water @ 20EC = 1g/cm³

- 8. SMPL DEPTH:** Depth of the precipitation sample. Calculated as:

$$SMPL\ DEPTH = \frac{(SMPL\ VOL) \times 10\ (mm/cm)}{A} \quad (2)$$

Where:
 SMPL DEPTH = sample depth
 SMPL VOL = sample volume in cm³ from equation (1).
 A = area of bucket orifice (642 cm²).

- 9. GAUGE DEPTH:** Depth of precipitation collected over the sampling period in the standard rain gauge or the shielded snow gauge. Reported as mm equivalents of water. NB. With the exception of Salmonier, all acid rain sites have the same types of equipment
- 10. COLL EFF (%):** Collection efficiency of the precipitation chemistry collector as compared to the rain or snow gauge.

$$COLL\ EFF = \frac{SMPL\ DEPTH}{GAUGE\ DEPTH} \times 100\% \quad (3)$$

Where: SMPL DEPTH = sample depth in mm as calculated from Equation (2).
 GAUGE DEPTH = depth of precipitation in mm from rain or snow gauge.

- 11. GAUGE TYPE:** Type of precipitation gauge used to measure the gauge depth. The types of gauges are as follows:

RG = rain gauge
 SG = shielded nipher snow gauge
 RC = recording gauge
 SR = snow ruler
 UN = unknown

- 12. PREC TYPE:** Type of precipitation collected in the precipitation collector during the week:

R = Rain
 S = Snow
 F = Freezing rain
 M = Mixed (any combination of R,S,F)
 D = Dew or Frost
 U = Uncertain

Explanation of terms - Weekly Precipitation Ion Concentrations

- 13. ION BAL:** The Ion Balance is the percent difference between cation and anion sums for a particular precipitation sample. The ion balance in µeq/L is calculated as follows:

$$ION\ BAL = \frac{(' ANIONS + CATIONS)}{(' ANIONS + CATIONS)} \times 100\% \quad (4)$$

Where: ' ANIONS = the anion sum and is calculated as follows:

$$\text{ANIONS} = \left(2 \times \frac{[SO_4^{2-}]}{96.06} + \frac{[NO_3^-]}{14.01} + \frac{[Cl^-]}{35.45} + 2 \times \frac{[GranAlk]}{100.09} \right) \times 1000 \quad (5)$$

And where:

' CATIONS = the cation sum and is calculated as follows:

$$\text{CATIONS} = \left(10^{-pH} + \frac{[NH_4^+]}{14.01} + \frac{[K^+]}{39.10} + 2 \times \frac{[Ca^{2+}]}{40.08} + 2 \times \frac{[Mg^{2+}]}{24.31} + \frac{[Na^+]}{22.99} \right) \times 1000 \quad (6)$$

Where square brackets [] indicates concentration in mg/L; [GranAlk] is gran alkalinity in mg of CaCO₃ per litre

14. pH: pH of the sample as measured in the laboratory.

15. H⁺ (mg/L): Hydrogen ion concentration calculated from the pH measurement as follows:

$$[H^+] = 10^{-pH} \times 1010 \quad (7)$$

Where: 10^{-pH} = the hydrogen ion concentration in mol/L.

1010 = the factor to convert from mol/L to mg/L of H⁺. (1.01 g/mol of H⁺ times 1000 mg/g.)

16. Cond.: Conductivity in µmhos as measured in the lab.

17. SO₄²⁻: Sulphate ion concentration in mg/L as measured in the lab.

18. XSO₄²⁻: Excess sulphate concentration in mg/L or sulphate concentration corrected for sea-salt. The sulphate concentration is corrected for sea-salt by using one of three equations (see below), the choice of which is determined by a computerized algorithm (see Appendix G). The algorithm computes the ratios of Mg²⁺/Na⁺, Na⁺/Cl⁻, Mg²⁺/Cl⁻ and compares these ratios to those in seawater.

$$[\text{SO}_4^{2-}] = [\text{SO}_4^{2-}] \quad 0.25[\text{Na}^+] \quad (8)$$

$$[\text{SO}_4^{2-}] = [\text{SO}_4^{2-}] \quad 2.09[\text{Mg}^{2+}] \quad (9)$$

$$[\text{SO}_4^{2-}] = [\text{SO}_4^{2-}] \quad 0.14[\text{Cl}^-] \quad (10)$$

19. NO₃⁻-N: Nitrate ion concentration expressed in mg/L as nitrogen.

20. Cl⁻: Chloride ion concentration expressed in mg/L.

21. NH₄⁺-N: Ammonium ion concentration expressed in mg/L as nitrogen.

22. Na⁺: Sodium ion concentration expressed in mg/L.

23. Ca²⁺: Calcium ion concentration expressed in mg/L.

24. Mg²⁺: Magnesium ion concentration expressed in mg/L.

25. K⁺: Potassium ion concentration expressed in mg/L.

26. ALK: Gran alkalinity expressed in mg of calcium carbonate per litre.

Explanation of terms - Annual Summary Statistics

1. SITE LOCATION:

The acid rain site location is identified by the **SITE** name, latitude (**LAT (N)**) and longitude (**LONG (W)**), and Universal Transverse Mercator coordinates (**UTM (N)** and **UTM (W)**).

2. ACID RAIN YEAR:

The sample year covered by the listing. It is specified by the calendar **YEAR**, the **START** and **END** dates, and the number of **DAYS** and **WEEKS** in the acid rain year.

3. TOTAL SAMPLE PERIODS:

The total number of sample periods. A sample period encompasses the time from the start date to the end date of the collection of one acid rain sample. For the NEPMoN program, a valid sample period should be not be less than six (6) days or greater than eight (8) days. For a complete and valid listing for a site, there should be 52 periods.

4. TRACE PRECIPITATION PERIODS:

The number of periods in the sampling year in which have trace amounts (i.e. less than 1 mm) of precipitation was collected. Not enough precipitation was collected to have enough sample to do the chemical analysis.

5. NON-TRACE PRECIPITATION PERIODS:

The number of periods in the sampling year in which enough precipitation fell to collect a sample large enough for chemical analysis (i.e. greater than 1 mm of precipitation).

6. # OF VALID SAMPLES:

The number of samples, determined for sample depth, gauge depth and the chemical parameters including ion balance, $[H^+]$ and excess $[SO_4^{2-}]$, that have been excepted as valid. For an explanation of the determination of whether a sample is valid or invalid, refer to Appendix E.

7. % OF VALID SAMPLES:

The percent of the total number of periods for which valid samples were collected.

$$\% \text{ OF VALID SAMPLES} = \frac{\text{VALID SAMPLES}}{\text{TOTAL SAMPLES}} \times 100 \quad (11)$$

Where: VALID SAMPLES = # OF VALID SAMPLES (number 6 above).
 TOTAL SAMPLES = # OF TOTAL SAMPLE PERIODS (number 3 above).

- 8. MEAN:** As calculated for the sample depth, gauge depth and ion concentrations including ion balance, $[H^+]$ and excess $[SO_4^{2-}]$, is the average of all valid samples for the summary year.

$$\bar{X} = \frac{1}{n} \sum_{i=1}^n X_i \quad (12)$$

Where: \bar{X} = average for all valid samples for the summary year
 X_i = the value for the i^{th} sample
 n = the total number of valid samples for the summary year.

9. STANDARD DEVIATION:

As calculated for the sample depth, gauge depth and ion concentrations including ion balance, $[H^+]$ and excess $[SO_4^{2-}]$, is the average absolute difference of each data point from the mean value. Only data from valid samples for the summary year are included in the calculation.

$$s = \sqrt{\frac{1}{n-1} \sum_{i=1}^n (X_i - \bar{X})^2} \quad (13)$$

Where: s = the standard deviation for all valid samples for the summary year
 X_i = the value for the i^{th} sample
 \bar{X} = the mean of all valid samples for the summary year.
 n = the total number of valid samples for the summary year.

- 10. MINIMUM:** The lowest value of all the valid samples for the summary year.

- 11. MAXIMUM:** The highest value of all the valid samples for the summary year.

12. PRECIPITATION WEIGHTED CONC. (mg/L):

The precipitation weighted mean concentration in mg/L over the summary period using the standard gauge depth as the weighting factor.

$$\overline{C}_{STND} = \frac{\sum_{i=1}^n C_i P_i}{\sum_{i=1}^n P_i} \quad (14)$$

Where: C_{STND} = precipitation weighted mean concentration based on the standard gauge depth.

C_i = the valid concentration for sample i.

P_i = the standard gauge depth for the same sample i with valid concentration.

n = the total number of valid samples for the summary period.

- 13. TOTAL GAUGE DEPTH:** The total precipitation amount for summary period measured in mm of precipitation.

$$TGD = \frac{\sum_{i=1}^n P_i}{5} \quad (15)$$

Where: TGD = total gauge depth.

P_i = the standard gauge depth for sample i.

n = the total number of valid samples for the summary year.

- 14. DEPOSITION (kg/ha/period):**

The deposition in kg/ha for the summary period based on the precipitation weighted concentration and the total gauge depth.

$$Dep'n = \frac{\overline{C}_{STND} \times (TGD)}{100} \quad (16)$$

Where: Dep'n = deposition

\overline{C}_{STND} = precipitation weighted mean concentration (see number 12 above)

TGD = total gauge depth (see number 13 above)

- 15. DEPOSITION (kg/ha/year):**

The yearly deposition based on the precipitation weighted mean, the total gauge depth and the ratio of days in a calendar year to the number of days in the summary period.

$$Dep\ n = \frac{(\bar{C}_{STND} \times (TGD))}{100} \times \frac{365}{No.Days(Summary)} \quad (17)$$

Where: Dep'n = deposition

\bar{C}_{STND} = precipitation weighted mean concentration (see number 12 above)

TGD = total gauge depth (see number 13 above)

No. Days (Summary) = number of days in the summary period (see number 2 above)

16. COLL. EFFIC. (% COLEFF), %VSL, %PCL, %TP, %VSMP:

Data completeness **measures** (refer to Appendix C) that are defined for each of the seasons as well as the entire summary period. Based on the lowest data completion measure for each assay for the year, an annual data completeness **level** is assigned for each data completeness assay.

17. SEA SALT CORRECTION:

The percent of the average sulphate concentration that is estimated be derived from sea salt, using sodium, magnesium or chloride as a tracer of sea salt.

$$\% \text{ sea salt correction} = \frac{(SO_4) - (XSO_4)}{(SO_4)} \times 100 \quad (18)$$

Where: SO_4 = sulphate deposition in kg/ha/year (see number 15 above)

XSO_4 = excess sulphate deposition in kg/ha/year

18. SEA SALT CORR.- LEVEL:

Based on the % sea salt correction, a sea salt correction level is assigned to the site for the summary period.

19. DATA COMPLETENESS LEVEL:

Annual data completeness level based on the poorest rating of the six data completeness levels.

20. OVERALL DATA QUALITY LEVEL:

The overall data quality data level for the site for the summary period. It is obtained by coupling the annual data completeness level with the site representativeness level.

APPENDIX E

Determination of Sample Validity - Assignment of Data Validity Flags.

The sample data set is scrutinised in order to remove items that were collected under conditions that might bias the values, and consequently skew the summary statistics. The process is conducted in two stages. The initial stage consists of a manual inspection of the sample history form and the relevant laboratory results. The second stage involves the identification of possible outliers using a computer routine.

(1) ASSESSMENT OF SAMPLE HISTORY FORMS AND LAB DATA

i) Sample Depth/Volume

Both the Sample Depth and Volume will be flagged INVALID if the following conditions pertain:

- (I1) - the sample is missing;
- (I2) - the sample has spilled or leaked;
- (I4) - is otherwise known to be in error;
- (I5) - the sample is a bulk sample (i.e. a sample which has been exposed to the atmosphere before or after the precipitation event);
- (I6) - the sample is confirmed as being an outlier.

If a sample represents only part of the precipitation that fell during the sample period, then the Sample Depth and Volume will be flagged VALID BUT QUALIFIED (Q1 or Q2). This means that the sample is not 100% representative of the precipitation that fell.

Any samples not having one of the flags mentioned above are assumed to be VALID (V0).

ii) Gauge Depth

The Standard Gauge Depth will be flagged INVALID (I1) if the datum is missing.

The Standard Gauge Depth will be flagged VALID BUT QUALIFIED in the following circumstances:

- (Q1 - Q4) - an estimated value was used as there was no gauge measurement; or
- (Q5 - Q7) - a corrected value was used; or
- (Q9) - an error is suspected, but the measurement is accepted as the best estimate available.

In addition to the VALID flag (V0), there is a VALID - TRACE VALUE flag (V1) used when the gauge registers a trace amount (ie <0.2mm water equivalent) for the collection period.

iii) Collection Efficiency

The Collection Efficiency is flagged INVALID if:

- (I1) - the sample is missing;
- (I2) - the sample has been spilled or leaked;
- (I4) - the sample is known to be in error;
- (I5) - the sample is a bulk sample;
- (I6) - the sample is confirmed as being an outlier;
- (I7) - the standard gauge depth is less than 0.2 mm ("Trace"); or
- (I8) - the standard gauge depth has been set equal to the sample depth.

The Collection Efficiency is labeled VALID BUT QUALIFIED if:

- (Q1,Q2) - the sample represents only part of the precipitation that fell;
- (Q5) - the gauge depth had to be estimated;
- (Q6) - the gauge depth had to be corrected;
- (Q7) - the gauge depth was known to be in error but accepted as the best estimate.

iv) Ion Balance

The Ion Balance is labeled INVALID and not calculated if:

- (I1) - the sample was insufficient;
- (I2) - the sample is missing;
- (I3) - the sample was too contaminated to analyze;
- (I4) - the sample was contaminated in the laboratory;
- (I5) - the sample was contaminated in the field;
- (I6) - one or more concentration values were determined to be an outlier;
- (I7) - one or more concentration values were invalidated because of poor ion balance; or
- (I8) - the sample was invalidated because it was a bulk sample

The Ion Balance is flagged as VALID BUT QUALIFIED in the following circumstances:

- (Q5) - the sample is suspected of being contaminated based on one or more suspect concentrations but there is no corroborating evidence;
- (Q6) - the sample is known to have leaked.

v) Concentrations

The flags for the Concentrations are similar to those for the Ion Balance with the addition of the following flags:

The Ion Balance is flagged as VALID BUT QUALIFIED in the following circumstances:

- (Q1) - the sample represents a non standard collection period ie it is not 7 days;
- (Q3) - the particular ion is considered a statistical outlier.

The Ion Balance is flagged as VALID (V2) when the datum represents a LESS THAN DETECTION LIMIT value.

vi) Excess SO₄²⁻ (XSO₄²⁻)

The flags for the excess sulphate data are similar to those for the ion concentrations with the addition of a number of VALID flags:

- (V0) - the “best case calculation” whereby sea salt ratios close to bulk seawater ratios;
- (V1) - less than detection limit for sulphate;
- (V2) - sea salt calculation based on sodium;
- (V3) - sea salt calculation based on magnesium;
- (V4) - sea salt ratio based on chloride;
- (V5) - excess sulphate set equal to the sulphate value as no valid indicator of sea salt was found.

(2) COMPUTERIZED ASSESSMENT OF DATA

After the manual input of the data validity flags mentioned above, the laboratory results are inspected using a computer program to determine if there are any statistical outliers. The outlier result is then flagged (Q3).

An individual data point is flagged as an outlier if it meets one of the following criteria:

- (a) If the pH > 6, then the pH value is qualified as an outlier. The value of 6 was used based on the authors’ experience and the chemistry of Newfoundland precipitation.
- (b) If the alkalinity > 0.9, then the alkalinity is qualified as an outlier. The value of 0.9 was used to identify outliers based on the 95% confidence interval for alkalinity.
- (c) For all other ions, the ion concentration in mg/L is multiplied by the Gauge depth. If this value is outside the 99% one-tailed interval for that ion, the ion is a statistical outlier. A statistical outlier is a datum whose value exceeds the value of the mean, plus or minus three standard deviations, estimated from all samples collected at that site over the entire existence of that site.

To determine if a value is a statistical outlier a z value is calculated as follows:

$$z_i = \frac{x_i - \bar{x}}{s} \quad (19)$$

where; z^i is the i^{th} z value

X_i is the value of the gauge depth multiplied by the ion concentration

\bar{X} is the sample mean (i.e. mean of all gauge depth multiplied by ion concentrations)

s is the sample standard deviation

The calculated z_i value is compared to the value of $z(A) = 2.326$ at the selected percentile of 0.99 (99%). If the calculated z_i value is greater than 2.326, then that result is deemed an outlier.

Determination of Sample Validity

Once each parameter of the sample has been identified as being **VALID; VALID BUT QUALIFIED** or **INVALID**, the computer program will continue to determine the validity of the entire sample. A sample will be invalidated if it meets one of the following criteria:

- (a) If a sample is missing, compromised, bulk or has a poor ion balance, the sample is immediately invalidated.
- (b) In the samples that have an ion sum $\geq 50 \text{ Feq/L}$, a sample will be invalidated if each of the three sea salt ratios (a, b, and c) and the acid ratio (d) fail to fall within the range 0.75 to 1.25. (Refer to Appendix G for a definition of these ratios). Samples invalidated for this reason are identified in the database by an I6 flag.
- (c) If $\geq 50\%$ of the components of the sample have Q flags associated with them, then the sample as a whole is invalidated. These samples are also identified in the database by an I6 flag.

All data that is invalidated by the screening procedure is flagged invalid and the values are not reported or used in the deposition calculations. All data that is valid, or qualified, is reported and is used in the calculation of deposition.

Figure 1 is a flow chart which summarizes the sample screening procedure.

Data Screening Flow Chart

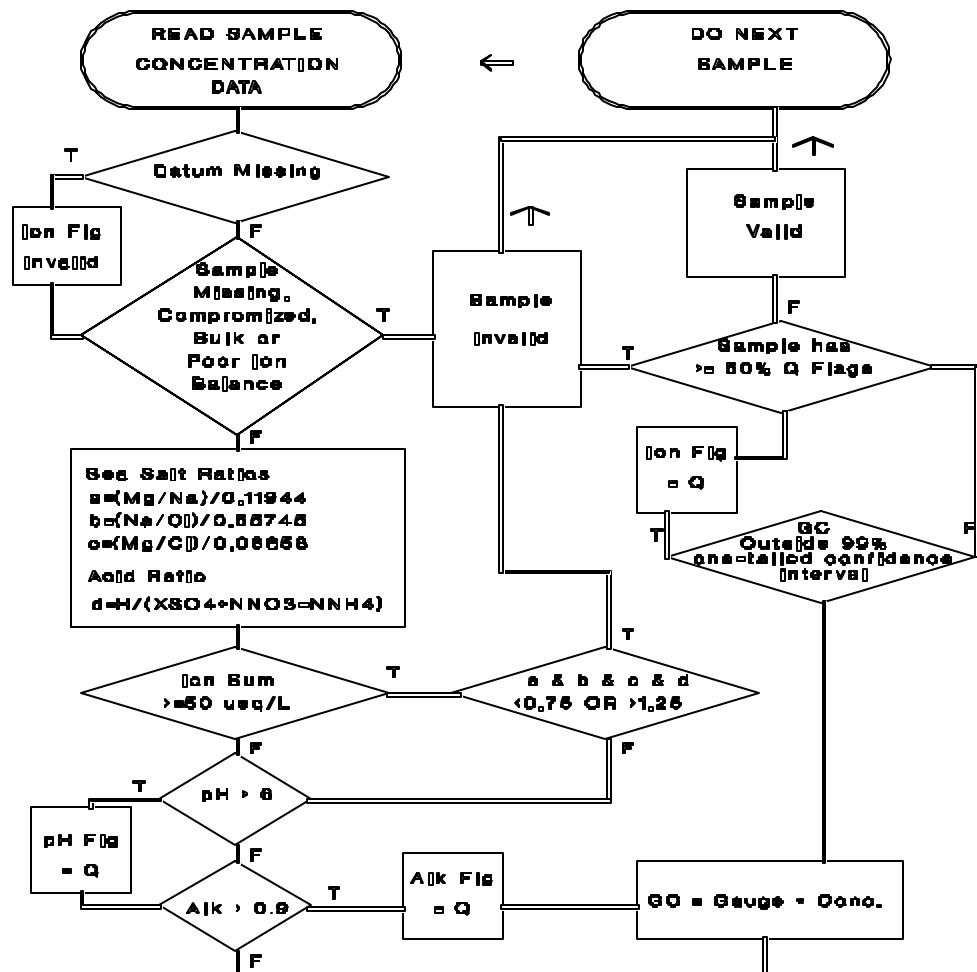

Figure 1

APPENDIX F

DEFINITION OF FLAGS

The system of flags used in this precipitation chemistry listing is a subset of the flags used in the CAPMoN Precipitation Chemistry Listing Summary - 1987. Any CAPMoN flag not used by NEPMoN is listed as NOT APPLICABLE.

Sample Volume (SMPL VOL) and Sample Depth (SMPL DEPTH) Flags

Flag Description

INVALID

- I1 **MISSING / NOT VALID** - No field weight reported and therefore no sample volume or sample depth available.
- I2 **INCORRECT - SAMPLE LEAKED OR SPILLED BEFORE WEIGHING** -The sample volume and sample depth are incorrect because the sample leaked or was spilled before it was weighed.
- I3 **NOT APPLICABLE.**
- I4 **INCORRECT - OTHER REASONS** - The sample volume and depth are known to be in error for other reasons. e.g. malfunctioning balance or improper use of balance.
- I5 **BULK SAMPLE** - A bulk sample is defined as a sample which has been exposed to the atmosphere before or after the precipitation event.
- I6 **OUTLIER CONFIRMED - INVALID**

VALID BUT QUALIFIED

- Q1 **PARTIAL EVENT COLLECTED (i.e. PARTIAL SAMPLE VOLUME)** - The sample volume and sample depth represents only part of the precipitation which fell during the week. Such cases generally correspond to collector malfunction or power failures.
- Q2 **POOR HOOD TO BUCKET SEAL ON COLLECTOR (POTENTIAL EVAPORATION)** - The calculated volume and depth may be lower than actual because the bucket was not sealed tightly by the collector hood. Sample evaporation may have occurred.
- Q3 **NOT APPLICABLE.**
- Q4 **NOT APPLICABLE.**

Q5	NOT APPLICABLE.
Q6	NOT APPLICABLE.
VALID	
V0	VALID - NO PROBLEMS - The sample volume and sample depth have no apparent problems and are considered to be valid.

Gauge Depth Flags

<u>Flag</u>	<u>Description</u>
--------------------	---------------------------

INVALID

I1	MISSING/NOT AVAILABLE - No value available. This occurs only in exceptional circumstances when measurements or estimates cannot be made.
-----------	---

VALID BUT QUALIFIED

Q1	ESTIMATED VALUE - EQUAL TO SAMPLE DEPTH - No standard gauge measurement was available so an estimated value equal to the sample depth was inserted for the standard gauge depth. This is done only when the standard gauge datum is not available.
Q2	ESTIMATED VALUE - EQUAL TO CO-LOCATED CLIMATE SITE VALUE - No standard gauge value was available so an estimated value equal to the co-located Climate Network Station's standard gauge value was inserted. This is done whenever standard gauge data are missing at sites with co-located Climate Station measurements. Note that Climate Station typically use snow rulers for snow depth measurements. In such cases, the Standard Gauge Type is coded accordingly.
Q3	ESTIMATED VALUE - EQUAL TO NEARBY CLIMATE STATION VALUE - No standard gauge value was available so an estimated value equal to the value from a nearby Climate Network site was inserted. (This gauge would not be co-located but located typically with 5 km of the collector site). This flag is used when neither a sample depth nor a co-located gauge value is available.
Q4	ESTIMATED VALUE - EQUAL TO SNOW RULER MEASUREMENT - No standard gauge value was available so an estimated value based on the on-site snow ruler measurements was inserted, i.e. the difference in snow depth between sample start time and end time divided by snow density factor of 10.
Q5	CORRECTED VALUE - EQUAL TO SAMPLE DEPTH - The standard gauge depth was detected to be in error and was corrected (i.e. replaced) by the sample depth value.

Q6 CORRECTED VALUE - EQUAL TO CO-LOCATED CLIMATE STATION VALUE - The standard gauge depth was detected to be in error and was corrected (i.e. replaced) by a co-located Climate Station value.

Q7 CORRECTED VALUE - EQUAL TO NEARBY CLIMATE STATION VALUE - The standard gauge depth was detected to be in error and was corrected (i.e. replaced) by a nearby (typically <5 km) climate station value.

Q8 NOT APPLICABLE

Q9 VALUE KNOWN OR SUSPECTED TO BE IN ERROR BUT BEST ESTIMATE AVAILABLE - The standard gauge depth was known or suspected to be in error (e.g. spilled) but was accepted as the best available estimate of precipitation depth.

VALID

V0 VALID DATUM - NO PROBLEMS - No problems were apparent and the datum was considered valid.

V1 VALID - TRACE VALUE - The standard gauge was TRACE, i.e. less than 0.2 mm water equivalent.

Collection Efficiency (COLL EFF) Flags

<u>Flag</u>	<u>Description</u>
--------------------	---------------------------

INVALID

I1 MISSING/NOT AVAILABLE - Collection efficiency could not be calculated because the SAMPLE DEPTH was missing or unavailable.

I2 INVALID - SAMPLE SPILLED OR LEAKED BEFORE WEIGHING - Collection efficiency invalid because the SAMPLE DEPTH was incorrect due to sample spilling or leaking before being weighed (see SAMPLE DEPTH FLAG = I2)

I3 NOT APPLICABLE

I4 INVALID - OTHER REASON(S) - Collection efficiency invalid because the SAMPLE DEPTH was known to be in error for other reasons (see SAMPLE DEPTH FLAG = I4).

I5 INVALID - BULK SAMPLE - Collection efficiency invalid because it applies to bulk sample with potential evaporative or snow escape losses (see SAMPLE DEPTH FLAG = I5).

- I6** **OUTLIER CONFIRMED INVALID**
- I7** **INDETERMINATE VALUE - STANDARD GAUGE DEPTH EQUALS TRACE**
- Collection efficiency could not be calculated because the GAUGE DEPTH = TRACE (<0.2mm).
- I8** **INVALID CALCULATION - STANDARD GAUGE DEPTH = SAMPLE DEPTH**
- Invalid collection efficiency calculation because the STANDARD GAUGE DEPTH was set equal to the SAMPLE DEPTH (i.e. STANDARD GAUGE DEPTH FLAG = Q1 OR Q5).

VALID BUT QUALIFIED

- Q1** **PARTIAL SAMPLE** - Collection efficiency for a partial sample only (see SAMPLE DEPTH FLAG = Q1).
- Q2** **POOR HOOD-TO-BUCKET SEAL ON COLLECTOR (POTENTIAL EVAPORATION)** - Collection efficiency susceptible to negative bias due to possible evaporation of sample.
- Q3** **NOT APPLICABLE**
- Q4** **NOT APPLICABLE.**
- Q5** **ESTIMATED GAUGE DEPTH** - The standard gauge depth was estimated from Climate Station or snow ruler data (see GAUGE DEPTH FLAGS Q2 TO Q4).
- Q6** **CORRECTED GAUGE DEPTH** - The standard gauge depth was corrected based on Climate Station or snow ruler data (See GAUGE DEPTH FLAGS Q6 TO Q7).
- Q7** **GAUGE DEPTH IN ERROR BUT BEST AVAILABLE ESTIMATE** - The standard gauge depth was known, or suspected, to be in error but was accepted as the best available estimate.

VALID

- V0** **VALID DATUM - NO PROBLEMS** - No problems were apparent and the datum is considered to be valid.

Ion Balance (IONBAL) Flags

<u>Flag</u>	<u>Description</u>
INVALID	
I1	NOT CALCULATED - INSUFFICIENT SAMPLE - One or more concentration values missing due to insufficient sample volume (see CONCENTRATION FLAG = I1).
I2	NOT CALCULATED - NO SAMPLE - Concentration data not available because sample was missing (see CONCENTRATION FLAG = I2).
I3	NOT CALCULATED - TOO CONTAMINATED TO ANALYZE - No concentration data available -- lab discarded sample because it was too contaminated to analyze (see CONCENTRATION FLAG = I3.)
I4	NOT CALCULATED - LAB CONTAMINATION - One or more concentration values invalid due to known laboratory contamination (see CONCENTRATION FLAG = I4).
I5	NOT CALCULATED - FIELD CONTAMINATION - One or more concentration values invalid due to known field contamination (see CONCENTRATION FLAG = I5).
I6	NOT CALCULATED - OUTLIER DETECTED - One or more concentration values were determined to be an outlier.
I7	POOR ION BALANCE - One or more concentrations invalid because of poor ion balance (see CONCENTRATION FLAG = I7).
I8	NOT CALCULATED - BULK SAMPLE - All concentrations are invalid because the sample was known to be a bulk sample (see CONCENTRATION FLAG = I8).
I9	NOT APPLICABLE
VALID BUT QUALIFIED	
Q0	NOT APPLICABLE
Q1	NOT APPLICABLE
Q2	NOT APPLICABLE
Q3	NOT APPLICABLE
Q4	NOT APPLICABLE

Q5 **ONE OR MORE CONCENTRATIONS SUSPECTED CONTAMINATE BUT NO PHYSICAL EVIDENCE AVAILABLE - (see CONCENTRATION FLAG =Q5).**

Q6 **SAMPLE LEAKED - CONCENTRATIONS MAY BE AFFECTED - (see CONCENTRATION FLAG - Q6).**

VALID

V0 **VALID CALCULATION** - Calculation considered valid because all concentration data valid.

V1 **NOT APPLICABLE**

Concentration Flags

Concentrations are reported in mg/l for SO_4^{2-} , XSO_4^{2-} , NO_3^- -N, Na^+ , Ca^{2+} , Mg^{2+} , K^+ and in pH units for pH. The flags provide information on the validity of the concentration data.

Flag **Description**

INVALID

I1 **MISSING DATUM - INSUFFICIENT SAMPLE** - No concentration datum available because the sample volume was insufficient for complete analysis.

I2 **MISSING DATUM - NO SAMPLE** - No concentration datum available because a sample was not collected or a sample was collected but not submitted to the laboratory.

I3 **MISSING DATUM - TOO CONTAMINATED TO ANALYZE** - no concentration datum available because laboratory personnel considered the sample to be too contaminated with visible particles or debris to be analyzed.

I4 **REJECTED DATUM - KNOWN LABORATORY CONTAMINATION OF ONE OR MORE IONS** - The datum reported by the laboratory was deemed INVALID because the sample was contaminated in the laboratory.

I5 **REJECTED DATUM - FIELD CONTAMINATION AND/OR NONCONFORMING OPERATION PROCEDURES** - The concentration datum was deemed invalid because of: (1) evidence of field contamination (e.g. hair in sample); and/or (2) evidence that the operator was not following standard operating procedures so sample integrity may have been compromised.

I6 **ENTIRE SAMPLE CONFIRMED AS INVALID** - An entire sample can be determined to be invalid in two ways: (1) In samples with an ion sum $\leq 50 \mu\text{eq/L}$, failure to have a sea salt or acid ratio within the range $0.75 \leq X \leq 1.25$ will result in the sample

being invalidated. (2) If 50% or greater of the ion concentrations of a sample were considered to be statistical outliers, then the entire sample is invalidated (see Appendix E).

I7 **REJECTED - POOR ION BALANCE** - Concentration datum was considered invalid because it corresponded to a sample which had a very large ion balance and very inconsistent concentration values.

I8 **REJECTED - BULK SAMPLE** - Sampler cover was open before or after a precipitation event possibly allowing dry deposition to collect in the sample bucket.

I9 **NOT APPLICABLE**

VALID BUT QUALIFIED

Q1 **NON-STANDARD SAMPLE PERIOD** - The sample represents a non-standard week (sample period not 7 days), non-bulk sample. Multi-day, wet-only samples are deemed Valid but Qualified because they are not collected using standard operating procedures.

Q2 **NOT APPLICABLE**

Q3 **ION IS CONSIDERED A STATISTICAL OUTLIER** - A statistical outlier is a datum whose value exceeded the value of the mean plus three standard deviations of all concentrations for that site for a year.

Q4 **NOT APPLICABLE**

Q5 **CONTAMINATION SUSPECTED BUT NO PHYSICAL EVIDENCE AVAILABLE** - The data is suspected because of potential but no supporting evidence is available on the sample history form.

Q6 **SAMPLE LEAKED** - The sample leaked in the field or in transit.

VALID

V0 **VALID DATUM - NO PROBLEMS** - The concentration datum was above the detection limit and appeared to have no problems.

V1 **NOT APPLICABLE**

V2 **LESS THAN DETECTION LIMIT VALUE** - The concentration datum represents a LESS THAN DETECTION LIMIT (LDL) value where LDL is defined as the analytical detection limit equal to three standard deviations of the baseline noise level. Actual LDL values are presented in the database with a 'less than' sign and are summarized in Table 1.

V3 **NOT APPLICABLE**

5.9 Excess SO₄²⁻ (XSO₄²⁻) Flags

<u>Flag</u>	<u>Description</u>
INVALID	
I1	NO CALCULATION - SO ₄ ²⁻ Missing due to insufficient sample (See CONCENTRATION FLAG =I1)
I2	NO CALCULATION - SO ₄ ²⁻ Missing due to missing sample (See CONCENTRATION FLAG = I2).
I3	NO CALCULATION - SO ₄ ²⁻ Missing because sample was too contaminated to analyze (see CONCENTRATION FLAG =I3)
I4	NO CALCULATION - SO ₄ ²⁻ Invalid due to lab contamination. (See CONCENTRATION FLAG I4).
I5	NO CALCULATION - SO ₄ ²⁻ Invalid due to field contamination or nonconforming operating procedures (See CONCENTRATION FLAG = I5)
I6	OUTLIER - CONFIRMED INVALID - Datum failed all of the sea-salt and acid ratios (see Appendix A).
I7	NO CALCULATION - SO ₄ ²⁻ Invalid because of poor ion balance (see CONCENTRATION FLAG =I7)
I8	NO CALCULATION - SO ₄ ²⁻ Invalid because of bulk Sample (See CONCENTRATION FLAG = I8)
I9	NOT APPLICABLE
VALID BUT QUALIFIED	
Q1	SO₄²⁻ QUALIFIED - Non-standard sample period (See CONCENTRATION FLAG = Q1)
Q2	NOT APPLICABLE
Q3	ION IS CONSIDERED A STATISTICAL OUTLIER - Datum's value exceeded the value of the mean plus three standard deviations of all concentrations for that site for a year.
Q4	NOT APPLICABLE

Q5 **SO₄²⁻ QUALIFIED** - Contamination suspected but no evidence (See CONCENTRATION FLAG = Q5)

Q6 **SO₄²⁻ QUALIFIED** - SAMPLE LEAKED (see CONCENTRATION FLAG = Q6)

VALID

V0 **"BEST CASE CALCULATION" WHEREBY SEA SALT PARAMETERS APPEAR IN RATIOS CLOSE TO BULK SEAWATER RATIOS** - XSO₄²⁻ was calculated using sodium as the sea salt indicator since this ratio to magnesium was within $\pm 25\%$ of the Na⁺/Mg²⁺ ratio in bulk seawater.

V1 **LESS THAN DETECTION LIMIT OR NONDETECTABLE VALUE OF XSO₄²⁻**
- The measured SO₄²⁻ concentration was LDL or ND so the excess sulphate value was assigned LDL or ND.

V2 **CALCULATION BASED ON SODIUM** - The constituent ratios in the sample were not within $\pm 25\%$ of the bulk seawater ratios but sodium was still the best indicator and the calculation was therefore based on sodium.

V3 **CALCULATION BASED ON MAGNESIUM** - magnesium appeared to be the best indicator of seasalt and excess sulphate was calculated based on magnesium.

V4 **CALCULATION BASED ON CHLORIDE** - chloride appeared to be the best indicator of seasalt and excess sulphate was calculated based on chloride.

V5 **XSO₄²⁻ SET EQUAL TO SO₄²⁻** - No valid indicator of sea salt was found; XSO₄²⁻ was set equal to the measured sulphate in the sample.

APPENDIX G

Calculation of Sea Salt Ratios and Sea Salt Correction

The sea salt ratios are the ratios of Mg^{2+}/Na^+ , Na^+/Cl^- and Mg^{2+}/Cl^- as compared to these ratios in seawater. For each sample the following values are calculated:

$$a = \frac{\left(\frac{[Mg^2]}{[Na]} \right)_{sample}}{\left(\frac{[Mg^2]}{[Na]} \right)_{seawater}} \quad (20)$$

$$b = \frac{\left(\frac{[Na]}{[Cl]} \right)_{sample}}{\left(\frac{[Na]}{[Cl]} \right)_{seawater}} \quad (21)$$

$$c = \frac{\left(\frac{[Mg^2]}{[Cl]} \right)_{sample}}{\left(\frac{[Mg^2]}{[Cl]} \right)_{seawater}} \quad (22)$$

where all ion concentrations are in mg/L

The acid ratio is the ratio of hydrogen ion to the excess sulphate plus the nitrate minus the ammonia. This acid ratio, d, is calculated as follows:

$$d = \frac{[H]}{[XSO_4^2] - [N\ NO_3] - [N\ NH_4]} \quad (23)$$

where all concentrations are in $\mu eq/L$

Ratios a, b, c, and d should theoretically all equal one. Each ratio is evaluated and if the total ion sum for the sample is $\leq 50 \mu g/L$ and (a) and (b) and (c) and (d) are all <0.75 or >1.25 , the entire sample is invalidated and it is flagged as I6. The evaluation of the salt and acid ratios is intended to eliminate samples which are contaminated and no other supporting evidence of contamination exists.

ALGORITHM TO DETERMINE WHICH ION CONCENTRATION TO USE IN THE SEA-SALT CORRECTION:

* Calculation of excess sulphate

Do if (cla > 0).

Do if (naa > 0 and mga > 0).

Do if (a >= 0.75 and a <= 1.25).

Compute xso4a = (so4a - (0.24966 * naa)).

Else if ((b <= 0.75 or b >= 1.25) and (c >= 0.75 and c <= 1.25)).

Compute xso4a = (so4a - (2.09015 * mga)).

Compute xso4flg = "V3".

Else if ((b >= 0.75 and b <= 1.25) and (c <= 0.75 or c >= 1.25)).

Compute xso4a = (so4a - (0.24966 * naa)).

Else if (abs(b-1) < abs(c-1)).

Compute xso4a = (so4a - (0.24966 * naa)).

Compute xso4flg = "V2".

Else.

Compute xso4a = (so4a - (2.09015 * mga)).

Compute xso4flg = "V3".

End if.

End if.

If (cla > 0 & naa > 0 & sysmis (mga)) xso4a = (so4a - (0.24966 * naa)).

If (cla > 0 & mga > 0 & sysmis (naa)) xso4a = (so4a - (2.09015 * mga)).

If (cla > 0 & sysmis (mga) & sysmis (naa)) xso4a = (so4a - (0.13917 * cla)).

If (cla > 0 & naa > 0 & sysmis (mga)) xso4flg = "V2".

If (cla > 0 & mga > 0 & sysmis (naa)) xso4flg = "V3".

If (cla > 0 & sysmis (mga) & sysmis (naa)) xso4flg = "V4".

End if.

Do if (sysmis(cla)).

If (mga > 0) xso4a = (so4a - (2.09015 * mga)).

If (naa > 0) xso4a = (so4a - (0.24966 * naa)).

If (naa > 0 and mga > 0) xso4a = (so4a - (0.24966 * naa)).

End if.

Execute.

Compute xso4e = xso4a/48.033.

Compute d = he/(xso4e + nno3e - nnh4e).

If (xso4a < 0) xso4flg = "I6".

* Derive I6 based on salt ratios

Do if (ions >= .05).

If ((a<.75 | a>1.25) & (b<.75 | b>1.25) & (c<.75 | c>1.25) & (d<.75 | d>1.25)) ionflg = "I6".

End if

.Execute.
