

# New Sensor- and Software Concepts for Reliable Operation of Real-Time Water Quality Monitoring Systems (part 1)

**Real-Time Water Quality Monitoring Workshop  
St. John's, June 16th and 17<sup>th</sup>, 2009**

**Reliable Operation of Real-Time Water Quality Monitoring Systems**

© s::can Messtechnik  
p.1

## **Part 1:**

### **New Sensor- and Software Concepts for Reliable Operation of Real-Time Water Quality Monitoring Systems (Part 1)**

- About s::can
- Sensors and stations
- Soft- and hardware for sensor management and data validation
- Software for event detection

## **Part 2:**

### **Real-Time Water Quality Monitoring Systems: The Vienna Experience (Part 2)**

- About UV-Vis Spectrometry: Principle, Advantages
- Perspective of sensor networks based on UV spectrometry
- Water monitoring applications in Vienna, Austria
- From Source to Drink, from Drink to Waste, back to the River and into the Groundwater

## Who is s::can ?

**Designer and manufacturer of optical online instrumentation  
in Vienna, Austria, since 1999**

:

**established OnLine Spectrometry as an accepted method for many  
parameters in many countries**

:

**World leader in online UV spectrometry with  
> 2300 Systems sold**

:

**Today, provider of a full range of plug-and-measure  
water quality sensors**

:

**Focus on low maintenance sensors and innovative sensor  
management software, that make possible the old dream of highly-  
reliable, high-resolution, multi-sensor monitoring networks**

**Reliable Operation of Real-Time Water Quality Monitoring Systems**

## The s::can sensor philosophy

- 
- 
1. **On-Line Only**
  2. **Plug & Measure**
  3. **Can be operated by uneducated staff**
  4. **Lowest Maintenance**
  5. **Long-Term-Stable**
  6. **Multi-Parametric**
  7. **Works-Calibrated**
  8. **Lowest cost in > 3 years of operation**
- 
- 

**Reliable Operation of Real-Time Water Quality Monitoring Systems**

## The Full Range Online

Reliable Operation of Real-Time Water Quality Monitoring Systems

### **0.5-5mm (waste water)**

**+ waste water: ppm to g/l**  
**+ sewer system**

#### **+ processes / industries**

- paper
- wine
- beer
- juices
- oils
- petrochemical
- biotech
- .....

### **35 mm (sensitive)**

**+ general water monitoring: ppb to ppm**

- river water, bank filtrate
- sea water
- groundwater, -recharge
- drinking waters
- compliance of WWTP
- treatment processes

**+ alarm / early warning systems**

### **100 mm (ultra sensitive)**

**+ water monitoring: low ppb**

- low turbidity drinking waters: alarm  
+ protection / security / distribution system monitoring
- ground waters (organic contamination)
- sea water
- ultra pure waters

#### **+ processes / industries**

- cooling waters
- pharma
- electronics industries

**Reliable Operation of Real-Time Water Quality Monitoring Systems**

## The Sensors: digital, intelligent, almost zero maintenance

### chlori::lyser: Total or Free Chlorine:

**\_pro:** pH-compensated; no zero calibration necessary

**\_eco:** next generation: solid state, not compensated, no maintenance, just exchange head.

### condu::lyser\_pro

digital sensor, either toroidal or direct, today's highest possible level of accuracy and quality

### **NEW 2009** condu::lyser\_eco

digital sensor; direct measurement; high accuracy for price sensitive applications

### pH::lyser\_diff

digital sensor; differential - former GLI – sensor; world wide best acknowledged pH sensor on the market

### **NEW 2009** pH::lyser\_pro

non-porous, “solid-state”, slow-ageing Reflex electrode for most difficult and lowest maintenance applications; will replace differential pH.

Reliable Operation of Real-Time Water Quality Monitoring Systems

## **NEW!** ammo::lyser – plug&measure NH<sub>4</sub> measurement

- Fully integrated via RS485/modbusRTU
- no additional terminal
- ammo::lyser IV: 4 parameters: NH<sub>4</sub>, K, pH & Temp.
- Potassium-, pH- & Temperature compensated
- „Ionophore“ (ion selective liquid membrane)
- Long term stability outstanding for ion selective sensor
- 2-Weekly check of calibration recommended; typical re-calibration monthly in environmental, several months in waste water
- Auto cleaning (compressed air)
- Simple membrane replacement all 6 – 12 months (or even longer)
- Running costs a fraction of other brands, because membranes can be replaced separately
- Many other ions possible (i.e. Fluoride)
- close to 1.000 of predecessor version running word wide today

## **NEW:** chlори::lyser: pH- independent free chlorine

- “plug & measure”
- monitoring of free chlorine ( $\text{Cl}_2 + \text{HOCl} + \text{OCl}^-$ ), or total chlorine, or chlorine dioxide
- measuring principle: Amperometric (membrane covered), potentiostatic 3-electrode system
- internally compensates fluctuations of pH between 6.5 and 9
- stable at fluctuations of flow
- long term stable, lowest maintenance possible today
- operation via s::can terminals and s::can software
- range: 0 to 2 mg/l or 0 to 20 mg/l
- resolution: 0,001 mg/l
- response time: 90 % in 2 minutes
- operating range: 4 – 10 pH (can be increased to 12)
- typical performance with pH changes: < 5 % per pH unit between 6 and 9 pH; < 1 % at < 6 pH
- dimensions: 25 mm x 210 mm
- max. pressure: 1 bar (higher on request)
- operating temperature: 0 – 50 °C

Reliable Operation of Real-Time Water Quality Monitoring Systems

## The oxi::lyser – plug&measure Dissolved Oxygen

- Fully integrated via RS485 Bus, no extra terminal
- optical DO & Temperature
- Pre-calibration ex works
- No flow required
- Long term stable (drift < 1% per year)
- Only yearly check of calibration recommended
- No replacement of membrane, no consumables
- Warranty: 3 (5) years
- Self cleaning, integrated in compressed air system

Reliable Operation of Real-Time Water Quality Monitoring Systems

**NEW:** turbi::lyser: Turbidity according to USEPA method 180.1

- mounted submersed or in measuring cell
- s::can plug & measure
- monitoring of turbidity and temperature
- measuring principle: Optical (nephelometric), meets or exceeds USEPA 180.1 / version according to ISO 7027 in preparation
- perfect for drinking water and natural waters
- long term stable and maintenance free in process
- pre-calibrated ex works
- by-pass installation and measurement
- operation via s::can terminals and s::can software
- range: 0 to 100 NTU
- resolution: 0.001 NTU
- accuracy below 40 NTU: +/-2 % of reading or +/-0.02 NTU
- response time: 90 % in 2 minutes
- light source: Tungsten white light
- sample chamber material: ABS

## **NEW:** soli::lyser: TS (MLSS) for Waste Water

- s::can plug & measure
- measuring principle: Optical (infrared absorbance)
- perfect for waste water applications
- long term stable and maintenance free in process
- auto compensation of temperature
- auto cleaning via compressed air or water, fully integrated into s::can cleaning system
- pre-calibrated ex-works
- automatic self diagnostics
- operation via s::can terminals and s::can software
- range: 0 to 30.000 mg/l
- resolution: 10 mg/l (1.000 mg/l to 9.999 mg/l) resp. 100 mg/l (above 10.000 mg/l)
- accuracy: +/- 3 % of reading or +/- 20 mg/l (whichever is greater)
- response time: 90 % in 1 minute
- sensor drift less than 1 % per year

Reliable Operation of Real-Time Water Quality Monitoring Systems

## The „compact“ s::can-Station

- TOC
- DOC
- NO3
- Turbidity
- pH
- spec. conductance
- free Chlorine
- DO
- div. ISE, i.e. NH4, Fluoride, Chloride
- spectral alarms
- event detection

**100 x 80 x 30 cm**

**Reliable Operation of Real-Time Water Quality Monitoring Systems**

## size comparison

conventional station Endress+Hauser

**220 x 200 x 80 cm**

compact modular station

**100 x 80 x 30 cm**

micro-station

**55 x 35 x 35 cm**

**Reliable Operation of Real-Time Water Quality Monitoring Systems**

## The s::can microstation

con::cube

sample  
preparation

„autosampler“  
for 1 sample

- TOC
- DOC
- NO3
- Turbidity
- spectral alarms
- event detection
- pH
- spec. conductance
- free Chlorine
- ISE: NH<sub>4</sub>, Fluoride, etc.

**55 x 35 x 35 cm (!)**

Reliable Operation of Real-Time Water Quality Monitoring Systems

## Submersed Operation

Reliable Operation of Real-Time Water Quality Monitoring Systems

## Complex Monitoring Systems Will Not Work Without:

### **1. TRANSPARENT SENSOR AND STATION MANAGEMENT:** Clear and transparent management of all sensors and stations, synchronised both on a local and on a central level.

Sensor identity, and any occurrences like any manual change of settings, sensors or components, calibration, and any other activities, plus all messages from sensors must be logged.

all details are logged and stored in central data base so any non-event-related deviating data can be identified.

## Complex Monitoring Systems Will Not Work Without:

Avoid that alarms are being trained on unvalidated data or false alarms will result.

**2. DATA VALIDATION:** Automatic data validation provides that only “clean data” are used for further analysis, training and alarms.

## Monitoring / Alarm Systems in an Ideal World

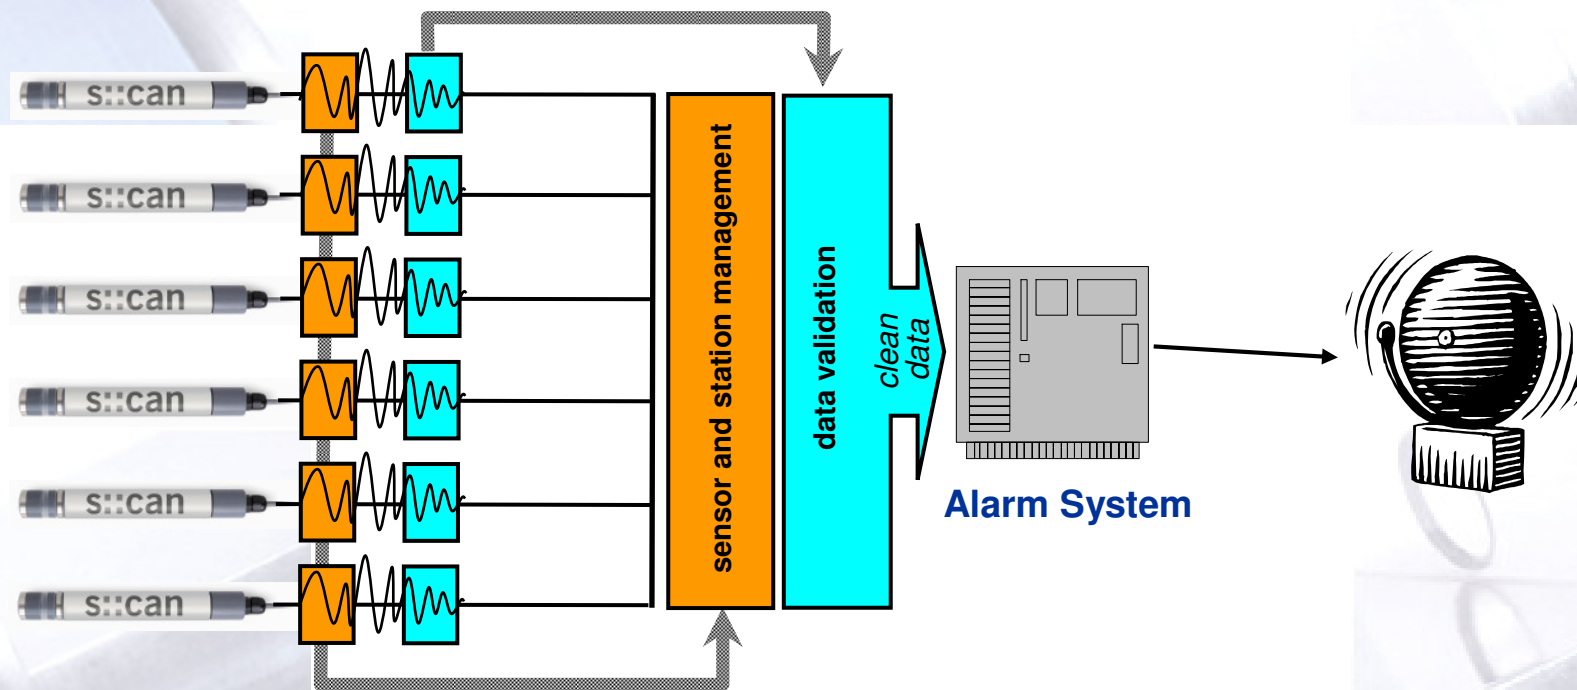

.... perfect sensors would directly feed clean data one-way into real-time data analysis / alarm system.

Reliable Operation of Real-Time Water Quality Monitoring Systems

## Monitoring / Alarm Systems in a Real World

.... best sensors still produce noisy data → need to be transparently managed → feed into sensor validation system → feed into data validation system → feed into further data analysis / alarm system

Reliable Operation of Real-Time Water Quality Monitoring Systems

## Local Data Validation = Precondition for any Alarm System

**Very subjective lesson learned** in 10 years of field experience, with hundreds of online water monitoring systems world wide, from small to very large (up to 130 stations / 500 parameters all 2 minutes in the largest one):

**Multi-station water quality monitoring systems without real-time data validation will lead to**

- non-interpretable data
- missed / ignored events
- unreliable / false alarms
- expensive field trips
- immense manual data cleaning work
- system overload
- low acceptance by operators as well as managers

**and just will not work sustainably.**

## Local Data Validation = Precondition for any Alarm System

- *For any time-critical system (alarm systems; process control) it is too late to validate + correct data in a central data base !*
- *To reduce complexity of your QAQC system, ensure good data quality as close to the source as possible. Let the sensor / controller do the job for you.*

Q1: System integrity ?

Q2: Installation integrity ?

Q3: Sensor integrity ?

Answers are calculated from

1. Provided sensor information (intelligent sensor protocol, digital outputs)
2. Station information (sample flow + pressure, camera pictures)
3. Enforced inputs during station visits via Web-based user interface
4. Real-Time data validation (and correction)

.... then stored in a local real-time data base, and synchronized to the outside world via diverse interfaces and protocols.

### con::cube - Monitoring Station

sensor interfaces (analog, digital, div. protocols)

SENSOR + STATION  
MANAGEMENT TOOL;  
DATA AND INFORMATION  
STANDARDISATION;  
WEB BASED USER  
INTERFACE

LOCAL REAL-TIME  
DATA BASE  
&  
REFERENCE DATA  
BASE

DATA VALIDATION &  
IDENTIFICATION OF SENSOR-RELATED ANOMALIES

validated data

training for identification of baseline of normal  
water quality and composition

REAL-TIME DATA ANALYSIS &  
LOCAL IDENTIFICATION OF WATER-RELATED  
ANOMALIES (EVENTS)

### SCADA System

operations data (pumps, valves, service activities,  
other logs, etc. )

### SCADA System

water quality monitoring data

### CENTRAL DATA BASE

STANDARDISED SENSOR AND STATION DATA  
DOCUMENTATION; CONFIGURATION AND  
INFORMATION MANAGEMENT

CENTRAL RAW DATA MANAGEMENT

CENTRAL CLEAN DATA MANAGEMENT

DATA VALIDATION + IDENTIFICATION  
OF SENSOR-RELATED ANOMALIES

CENTRAL DATA ANALYSIS &  
CENTRAL IDENTIFICATION OF WATER-RELATED  
ANOMALIES (EVENTS)

events

### CENTRALISED DATA WAREHOUSE

& OTHER operational data and information:  
LIMS; GIS; CIS; CMMS; public health data etc.

## Quality Management

- **Design Quality.** All system components should be built upon a QM approach, and not QM set up later on top of an existing technical approach.
- **Make it Simple.** Reduce the complexity of the system to the greatest extent possible by using the simplest and most reliable technology only.
- **Make it Intelligent.** Use intelligent software and automated, enforced, and transparent procedures, so only few procedures and decisions left to be Q-controlled.

## Quality Management

### The Quality Management Concept:

1. **Transparency** of system and all procedures.
2. **Traceability & enforced documentation** - every maintenance activity to be documented, documentation according to customized standards; no way to by-pass documentation otherwise systems will alarm.
3. **Feedback** given by software to all field activities, stored both locally and in central data system.
4. **Q-controlled (lab)-environment** used for any delicate work; no complex decisions and no delicate work in the field.
5. **Certification** - s::can can help with partners to certify and audit the system and procedures.

## con::cube - The Brain of the Micro-Station

### (6) The Station Controller – con::cube

- s::can industrial micro-PC
- smaller clone of well proven s::can con::stat
- for robustness no moving parts (runs on flash disk), solid state cooling, no display, minimum number of interfaces, “bullet proof” hermetical housing
- moni::tool software with comprehensive options for sensor and station management
- synchronization w SCADA / central data base provided (TML protocol), or other telemetry and protocol possible
- local access for configuration, calibration etc. via wired or wireless I/O module like PDA, or laptop, or mobile TouchScreen device, depending on preference.
- web based secure remote interface

## moni::tool - the Micro-Station Software

### (7) moni::tool - The station software

- open for any third party sensors / protocols / meta data
- Currently 4 modules, can be licensed independently:
  1. **moni::tool** sensor and station management
  2. **vali::tool** real-time data validation:
  3. **ana::larm + ana::tool** real-time local event detection:
  4. **repo::tool** reporting – generate your own format reports
- all data logged in Postgress data base: **measured values, spectra, sensor identities, and any occurrences like any changes of settings, sensors or components, calibration, and any other activities, plus all messages from sensors.**
- synchronized via XML w central data base (open); **any other protocols possible, i.e. Modbus RTU, STI12 / only for simple applications**

## moni::tool - the Micro-Station Software

### 1. moni::tool: Sensor / Station control and management tool

- easy and transparent sensor and station configuration, driven by a graphical user interface
- tracking of all activities and status information (this type of data is essential in an EDS system to explain signal changes i.e. due to maintenance)
- interfacing options for heterogeneous sensors via analogue and digital protocols, manufacturer independent

### 2. vali::tool: Data validation tool

- real-time analysis of incoming data from any source
- ensures only clean data is fed into the EDS
- plausibility, outliers, sudden jumps, drift, noise, both recognition and -correction possible
- avoid training of alarm systems on invalid data = false alarms

### 3. ana::tool: Event detection tool

- combines spectral alarms with additional parameter alarm tools
- static-, dynamic-, spectral-, pattern-, composite events
- allows alarming & response locally on the station (i.e. switching of autosamplers, pumps etc)

## The User Interface

### (7) The User Interface / Hardware

- PDA, laptop, or mobile TouchScreen device, any device that can run web applications is possible
- can be connected to con::cube via network cable or wireless, from any location in the world
- GUI is a web application running on any PC
- secure connection to con::cube, including ID check and secure password (see “Security Features”)

## The User Interface

### (8) The User Interface / Software

- ensures traceability of any local and remote activities
- physical access recognition enforces visitor to identify + register by connecting the Interface Device to station. Only ownership of Interface Device + secure code will allow registration.
- electronic log-book: visitor is enforced to log all activities during the physical visit (sensor and station maintenance, calibrations, cleaning, repairs, exchanges, etc.)

### STATUS CHECK

You are now logged on.

Please perform a visual inspection of the monitoring station. Check the following systems and tick the associated checkboxes if they are working correctly.

- ☐ Power supply is working correctly.
- ☐ Water supply is working correctly.
- ☐ System status is okay.
- ☐ Parameter status is okay.
- ☐ Automated cleaning is working correctly.

Is everything working correctly?

[Yes](#) [No](#)
