AESTHETIC: The perceived water quality may be lower due to the exceedance of the following aesthetic parameters in your last tap sample: - COLOR (Please see Tap Water report for details).				

A Drinking Water Quality Index (DWQI) is a means to summarize water quality data into simple terms (e.g. good) for reporting to the public in a consistent manner. Similar to the UV index or an air quality index , it tells us, in simple terms, what the quality of drinking water is from your drinking water supply.

Essentially the DWQI is calculated by comparing the water quality data to the Guidelines for Canadian Drinking Water Quality. This calculation produces a score between 0 and 100. A higher score means a better quality of drinking water. The scores are then ranked into one of the six categories described below:

Excellent: (DWQI Value 95-100) - Water quality is protected with a virtual absence of impairment; conditions are very close to pristine levels; these index values can only be obtained if all measurements meet recommended guidelines virtually all of the time.

Very Good: (DWQI Value 89-94) - Water quality is protected with a slight presence of impairment; conditions are close to pristine levels.

Good: (DWQI Value 80-88) - Water quality is protected with only a minor degree of impairment; conditions rarely depart from desirable levels.

Fair: (DWQI Value 65-79) - Water quality is usually protected but occasionally impaired; conditions sometimes depart from desirable levels.

Marginal: (DWQI Value 45-64) - Water quality is frequently impaired; conditions often depart from desirable levels.

Poor: (DWQI Value 0-44) - Water quality is almost always impaired; conditions usually depart from desirable levels
