

Butler's Sand & Stone Co. Ltd

Water Resources Management Plan

RE: EA 1889

White Hill Pond Quarry

There are not any bodies of water located within the quarry perimeter. The area is bordered to the West by Weir's Construction quarry site, and to the East are potential quarry sites, with access corridors of 20 metres wide surrounding each quarry site, as per direction of Mines and Energy. There is a vegetated buffer between Weir's Construction quarry site (to the west side of our application) and White Hill Pond of approximately 250 Metres. On the East there is a vegetated buffer between the quarry site and a wetland / stream area of approximately 280 Metres. The North border of the site is an active quarry, the south side is all vegetation.

Rainfall run off will be controlled with drainage berms to a settling pond. Any organics that are stripped from the site will stockpiled on site, to be used for restoration. As progression is made through the quarry, restoration will be provided to worked areas as an ongoing process.
