# Grading Standards <br> Chemistry 3202 <br> June 2009 

## Pre-Marking Appraisal

The examination was considered fair and rigidly adhered to the examination Table of Specifications.

## Post Marking Report

## a) Marking Standard and Consistency

Marker reliability was checked by obtaining a random sample of 50 examinations. These examinations were scored on separate back flaps with no physical markings on the original examinations and were held by the Chief Marker for recirculation throughout the marking period. These papers were corrected by the marking board again, and the initial and subsequent marks were compared. Any discrepancies in marking were reviewed and discussed with individual markers. Each marker also made on-going notes regarding partial marks and scoring for their particular question. Whenever a non-common error occurred, it was scored by consensus of the board and made note of, for scoring consistency.
b) Summary

Overall performance in the Chemistry 3202 examination went down from June 2008 to June 2009, but was the second highest provincial score in the past five years. Core Lab and STSE outcomes are often assessed at higher cognitive levels. Teachers, therefore, should assess these areas of the course throughout the school year in a similar manner.

Teachers should also encourage students to read questions carefully and critically. Very often on the provincial examination, errors occur because students fail to read the whole question. If they read the complete question or read it several times, they are less likely to misinterpret the item and are more likely to perform better.

## c) Commentary on Responses

## Part I - Selected Response - Total Value: 50\%

Item \#9: Students did not read the question carefully. Many students chose an answer as though the equilibrium was shifting left.

Item \#13: Students did not recognize that the unknown could not have been an acid; it did not react with Mg.

Item \#14: Students confused the Arrhenius definition of a base with the Bronsted-Lowry definition.

Item \#23: Students did not recognize that the base, NaOH , will react with the acid, HF , in the equilibrium equation given.

Item \#24: Students confused the definition of equivalence point with the definition of endpoint.

Item \#33: Students confused the difference in endothermic and exothermic processes and the effect they have on their surroundings.

Item \#40: Many students did not use the bond energy formula correctly. They added 184.6 kJ (the $\Delta \mathrm{H}$ for the reaction) to the product bond energy and then subtracted the reactant bond energy.

Item \#45: Many students did not appear to recognize that Choice $C$ was not balanced in terms of charge; 6 negative on the left and 6 positive on the right.

Item \#46: Students showed poor understanding of direction of electron flow and ion flow.
Item \#48: Some students did not appear to understand the reaction that would take place in the cell described.

## Part II - Constructed Response - Total Value: 50\%

Value
2\%
51.(a) The reaction below has an activation energy of 209 kJ . Sketch a potential energy diagram for the reaction, and label the activation energy and heat of reaction.

$$
2 \mathrm{NO}_{2}(\mathrm{~g})+\mathrm{O}_{2}(\mathrm{~g})+199 \mathrm{~kJ} \rightarrow 2 \mathrm{NO}_{3}(\mathrm{~g})
$$

1 mark shape
$1 / 2 \operatorname{mark} \quad \mathbf{E}_{\mathbf{a}}$ $1 / 2 \operatorname{mark} \Delta H$

Progress of Reaction

## Common Errors

## Students:

- drew an exothermic shape.
- thought $\Delta \mathrm{H}$ was from products to top of graph; ie: $\mathrm{E}_{\mathrm{a}}(\mathrm{rev})$.
- labeled $E_{a}$ as $\Delta H$ and $\Delta H$ as $E_{a}$.

Value
$2 \% \quad$ 51.(b) For the reaction below, it takes longer to collect 35 mL of $\mathrm{CO}_{2}(\mathrm{~g})$ using acid at room temperature compared to acid at $60.0^{\circ} \mathrm{C}$. Explain why.

$$
\mathrm{CaCO}_{3}(\mathrm{~s})+\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq}) \quad \rightarrow \mathrm{CO}_{2}(\mathrm{~g})+\mathrm{CaSO}_{4}(\mathrm{~s})+\mathrm{H}_{2} \mathrm{O}(\ell)
$$

1 mark Room Temp is a lower temp, thus molecules are moving slower than those at $60^{\circ} \mathrm{C}$, thus they collide less often and with less intensity.

1 mark So there are fewer successful collisions having the activation energy and proper orientation thus taking longer.

> * Explained from the higher temp perspective acceptable as well.

## Common Errors

Students:

- used equilibrium for their explanation.
- did not include "increase in intensity" of collisions.
- did not include "results in more successful collisions" - or more collisions with the $\mathrm{E}_{\mathrm{a}}$ and proper orientation.

Value
$2 \% \quad 51 .(c)$ Using collision theory, explain why zinc metal reacts more rapidly in concentrated $\mathrm{HCl}(\mathrm{aq})$ than in dilute $\mathrm{HCl}(\mathrm{aq})$.
$1 / 2$ mark Concentrated $\mathbf{H C l}$ has more reactant particles.

1 mark More reactant particles means there are more collisions. More collisions means more will be successful having the activation energy
$1 / 2$ mark and proper orientation, thus reacting more rapidly.

## Common Errors

Students:

- did not include more particles because of greater concentration.
- did not include "results in more successful collisions" - or more collisions with the $\mathrm{E}_{\mathrm{a}}$ and proper orientation.

Value
$2 \% \quad 51 .(\mathrm{d})$ Inside a propane tank, the equilibrium below is created. When propane gas is released from the tank, explain why condensation forms on the outside of the tank.

$$
\mathrm{C}_{3} \mathrm{H}_{8}(\ell)+\text { Energy } \rightleftharpoons \mathrm{C}_{3} \mathrm{H}_{8}(\mathrm{~g})
$$

1 mark According to LCP, removal of $\mathrm{C}_{3} \mathrm{H}_{8}(\mathrm{~g})$ causes the equilibrium to try to replace it by shifting to the right, thus absorbing energy from the surroundings (tank).

1 mark The decreasing temperature of surroundings (tank) will cause water vapour outside of the tank to condense on its cold surface.

## Common Errors

Students:

- did not identify the question as an equilibrium question (shift right - absorbing heat from the surroundings).
- confused the direction of shift.

Value
$2 \% \quad$ 51.(e) For the reaction below, the graph shows how $\mathrm{A}_{2}(\mathrm{~g})$ and $\mathrm{B}_{2}(\mathrm{~g})$ come to equilibrium with $\mathrm{AB}(\mathrm{g})$ at constant temperature in a 1.0 L flask. Calculate the equilibrium constant.

$$
\mathrm{A}_{2}(\mathrm{~g})+\mathrm{B}_{2}(\mathrm{~g}) \rightleftharpoons \mathrm{C}_{3} \mathrm{H}_{8}(\mathrm{~g})
$$

Reaction Time (min)

1 mark Equilibrium values from the graph:
$\left[\mathrm{A}_{2}\right]_{\mathrm{eq}}=1.50 \mathrm{~mol} / \mathrm{L}$
$\left[B_{2}\right]_{\mathrm{eq}}=3.50 \mathrm{~mol} / \mathrm{L}$
$[\mathrm{AB}]_{\text {eq }}=5.00 \mathrm{~mol} / \mathrm{L}$
$1 / 2$ mark $\quad K=\frac{[A B]^{2}}{\left[A_{2}\right]\left[B_{2}\right]}=\frac{(5.00)^{2}}{(1.50)(\mathbf{3 . 5 0})}$
$1 / 2$ mark $\quad=4.76$

## Common Errors

Students:

- read incorrect equilibrium concentrations off the graph.
- attempted to determine equilibrium concentrations from initial concentrations and an ICE table.

Value
$3 \% \quad$ 51.(f) Calculate $\mathrm{K}_{\text {eq }}$ if 1.0 mol of $\mathrm{N}_{2} \mathrm{O}_{4}$ is initially placed into a 1.0 L vessel, and at equilibrium 0.75 mol of $\mathrm{N}_{2} \mathrm{O}_{4}$ remains in the vessel.

## Common Errors

## Students:

- identified ' $x$ ', as $0.75 \mathrm{~mol} / \mathrm{L}$, instead of $1.0-0.75=0.25 \mathrm{~mol} / \mathrm{L}$.
- did not multiply ' $x$ ' by 2 to get the equilibrium concentration of $\mathrm{NO}_{2}$.

Value
$4 \% \quad$ 52.(a) Calculate the pH of a $0.25 \mathrm{~mol} / \mathrm{L}$ solution of $\mathrm{NH}_{3}\left(\mathrm{~K}_{\mathrm{b}}=1.8 \times 10^{-5}\right)$.

| 1/2 mark | $\mathrm{NH}_{3}$ |  | $+\mathrm{H}_{2} \mathrm{O}$ | $\rightleftharpoons$ | $\mathrm{OH}^{-}$ | $\mathrm{NH}_{4}{ }^{+}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | I | 0.25 |  |  | 0 | 0 |
|  | C | - $\boldsymbol{x}$ |  |  | $+\boldsymbol{x}$ | $+\boldsymbol{x}$ |
| 1/2 mark | E | 0.25-x |  |  | $+x$ | $+x$ |

$1 / 2 \operatorname{mark} \quad$ Check: $\frac{\left[\mathrm{NH}_{3}\right]_{\mathrm{K}_{\mathrm{i}}}}{\mathrm{K}_{\mathrm{b}}}=\frac{0.25}{1.8 \times 10^{-5}}=13888>500$
1/2 mark
Thus assume $0.25-x \sim 0.25$

$$
\left.\mathrm{K}=\frac{\sqrt[\mathrm{OH}]{ }}{-}\right]\left[\mathrm{NH}_{4}^{+}{ }^{+}\right]
$$

$1 / 2 \operatorname{mark}$
$1.8 \times 10^{-5}=\frac{x^{2}}{0.25}$
½ mark

$$
x=2.1(2) \times 10^{-3}=\left[\mathrm{OH}^{-}\right]
$$

1/2 mark
$\mathrm{pOH}=-\log \left[\mathrm{OH}^{-}\right]=-\log 2.1(2) \times 10^{-3}=2.67$
$1 / 2 \operatorname{mark}$

$$
\mathrm{pH}=14.000-\mathrm{pOH}=14.000-2.67=11.33
$$

## Common Errors

Students:

- used the wrong reaction ie: $\mathbf{N H}_{\mathbf{3}}+\mathbf{H}_{\mathbf{2}} \mathbf{O} \rightarrow \mathbf{N H}_{\mathbf{2}}{ }^{-}+\mathbf{H}_{\mathbf{3}} \mathbf{O}^{+}$or no reaction.
- used $0.25 \mathrm{~mol} / \mathrm{L}$ as the $\left[\mathrm{OH}^{-}\right]$or $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$.
- did not check the assumption.
- used $\mathrm{pOH}=-\log \mathrm{K}_{\mathrm{b}}$.
- used $\left[\mathrm{OH}^{-}\right]=\left(\mathrm{K}_{\mathrm{b}}\right)(0.25)$.
$4 \% \quad 52 .(b)$ Calculate the concentration of a $10.00 \mathrm{~mL} \mathrm{CH}_{3} \mathrm{COOH}$ solution using the data provided from the standardization with a $0.1404 \mathrm{~mol} / \mathrm{L} \mathrm{NaOH}$ solution.

| Burette | Trial 1 | Trial 2 | Trial 3 |
| :---: | :---: | :---: | :---: |
| Final (mL) | 16.90 | 32.02 | 47.18 |
| Initial (mL) | 1.35 | 16.90 | 32.02 |
| Volume NaOH used (mL) | 15.55 | 15.12 | 15.16 |

```
\(1 / 2\) mark Average Volume of \(\mathrm{NaOH}=\frac{15.12+15.16}{2}=15.14 \mathrm{~mL}\)
\(1 / 2\) mark \(\mathrm{CH}_{3} \mathrm{COOH}+\mathrm{NaOH} \rightarrow \mathbf{C H}_{3} \mathbf{C O O N a}+\mathbf{H}_{2} \mathrm{O}\)
\(1 / 2 \operatorname{mark} \quad \mathrm{n}(\mathrm{NaOH})=\mathbf{c} \times v=(0.1404 \mathrm{~mol} / \mathrm{L})(0.01514)=0.002125(7) \mathrm{mol}\)
\(1 / 2\) mark \(\quad n\left(\mathrm{CH}_{3} \mathrm{COOH}\right)=\mathbf{0 . 0 0 2 1 2 5 ( 7 )} \mathbf{~ m o l} \times \underline{1 \mathrm{~mol} \mathrm{CH}_{3}} \underline{\mathrm{COOH}}\)
                                    1 mol NaOH
                                    \(=0.002125(7) \mathrm{mol}\)
```

1 mark $\quad \mathbf{c}=\frac{\mathbf{n}}{\mathbf{v}}=\frac{0.002125(7) \mathrm{mol}}{0.01000 \mathrm{~L}}=0.2126 \mathrm{~mol} / \mathrm{L}$

| Science Communication | $1 / 2$ mark units <br> $1 / 2$ mark significant figures |
| :--- | :--- |

## Common Errors

Students:

- averaged all three volumes, instead of two values, within 0.10 mL .
- used incorrect formulae; $\mathrm{C}=\mathrm{nV}$ or $\mathrm{n}=\mathrm{C} / \mathrm{V}$.
- used the dilution formula: $\mathrm{C}_{\mathrm{i}} \mathrm{V}_{\mathrm{i}}=\mathrm{C}_{\mathrm{f}} \mathrm{V}_{\mathrm{f}}$.
- did not show $1: 1$ mole ratio.

Value
$4 \% \quad 52$.(c) A solution is prepared by dissolving a 15.00 g sample of an alkali metal hydroxide, $\mathrm{MOH}(\mathrm{s})$, in enough water to make a 5.00 L solution. If the resulting pH is 12.466 , identify the metal, M .

|  | $\mathbf{M O H} \rightarrow \mathbf{M}^{+}+\mathbf{O H}^{-}$ |
| :---: | :---: |
| 1/2 mark | $\mathrm{pOH}=14.000-12.466=1.534$ |
| 1/2 mark | $\left[\mathrm{OH}^{-}\right]=10^{-\mathrm{pOH}}=10^{-1.534}=0.0292(4) \mathrm{mol} / \mathrm{L}$ |
| 1/2 mark | $\mathrm{n}_{(\mathrm{OH}-)}=\mathbf{c ~ v}=(0.0292(4) \mathrm{mol} / \mathrm{L})(5.00 \mathrm{~L})=0.146(2) \mathrm{mol}$ |
| 1/2 mark | $\mathbf{n}_{(\mathbf{M O H})}=\mathbf{n}_{(0 \mathrm{OH}-)} \quad($ Ratio 1:1) |
| 1/2 mark | $M_{(\mathrm{MOH})}=\frac{m}{\mathrm{n}}=\frac{15.00 \mathrm{~g}}{0.146(2) \mathrm{mol}}=102.6 \mathrm{~g} / \mathrm{mol}$ |
| 1/2 mark | $\begin{aligned} \mathbf{M}_{(\mathrm{M})} & =\mathbf{M}_{(\mathrm{MOH})}-\mathrm{M}_{(\mathrm{OH}-)} \\ & =102.6 \mathrm{~g} / \mathrm{mol}-17.01 \mathrm{~g} / \mathrm{mol} \\ & =85.6 \mathrm{~g} / \mathrm{mol} \end{aligned}$ |
| 1 mark | M is $\mathbf{R b}$; rubidium. |

## Common Errors

Students:

- did not include mole ratio.
- did not subtract the molar mass of $\mathrm{OH}^{-}$from the calculated molar mass.
- calculated the $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$, but not $\left[\mathrm{OH}^{-}\right]$.
- tried to use an ICE table.
- re-arranged the formulae, $\mathrm{c}=\mathrm{n} / \mathrm{v}$ and $\mathrm{n}=\mathrm{m} / \mathrm{M}$, incorrectly.
- did not choose an alkali metal.
- did not attempt even part of the question.

## Value

$2 \% \quad$ 52.(d) A base is titrated with a strong acid to produce the graph below. Explain whether the base is strong or weak.

1 mark The base is weak.

1 mark This is because the $\mathbf{p H}$ at the equivalence point is less than 7.

## Common Errors

Students:

- referred to the starting pH of the graph as the explanation, rather than the equivalence point.
- did not read the question carefully and discussed acid strength or suggested indicators for the titration.

Value
$2 \% \quad$ 53.(a) A 100.0 g chocolate $\operatorname{bar}\left(\mathrm{C}_{7} \mathrm{H}_{8} \mathrm{~N}_{4} \mathrm{O}_{2}\right)$ is burned in a bomb calorimeter that has a heat capacity of $6.50 \mathrm{~kJ} /{ }^{\circ} \mathrm{C}$. Calculate the molar heat of combustion of the chocolate bar if the temperature of the calorimeter and its contents increases from $21.90^{\circ} \mathrm{C}$ to $27.40{ }^{\circ} \mathrm{C}$.
1 mark

$$
\begin{aligned}
\mathbf{q}(\text { system }) & =-\mathbf{q}(\text { surroundings) } \\
\mathbf{q}(\text { chocolate }) & =-\mathbf{q}(\text { (calorimeter) } \\
& =-(\mathbf{C} \Delta \mathrm{T}) \\
& =-\left[6.50 \mathrm{~kJ} /{ }^{\circ} \mathrm{C}\left(27.40^{\circ} \mathrm{C}-21.90^{\circ} \mathrm{C}\right)\right] \\
& =-\left[\left(6.50 \mathrm{~kJ} /{ }^{\circ} \mathrm{C}\right)\left(5.50^{\circ} \mathrm{C}\right)\right] \\
& =-35.7(5) \mathrm{kJ}
\end{aligned}
$$

½ mark
$n\left(C_{7} H_{8} N_{4} \mathrm{O}_{2}\right)=\frac{m}{M}=\frac{100.0 \mathrm{~g}}{180.19 \mathrm{~g} / \mathrm{mol}}=0.5549(7) \mathrm{mol}$
½ mark
$\Delta H_{\text {comb }}=\frac{q}{n}=\frac{-35.7(5) \mathrm{kJ}}{0.5549(7) \mathrm{mol}}=-64.4 \mathrm{~kJ} / \mathrm{mol}$

## Common Errors

Students:

- used $\mathrm{q}=\mathrm{mc} \Delta \mathrm{T}$ instead of $\mathrm{q}=\mathrm{C} \Delta \mathrm{T}$ for the calorimeter.
- did not use $1^{\text {st }}$ Law of Thermodynamics, ie: $\mathrm{q}_{\text {system }}=-\mathrm{q}_{\text {surroundings }}$.
- used $6.50 \mathrm{~kJ} /{ }^{\circ} \mathrm{C}$ as ' $q$ ', not 'C'.
- converting from kJ to J incorrectly.
- used $\mathrm{q}=\mathrm{mc} \Delta \mathrm{T}$ instead of $\mathrm{q}=\mathrm{n} \Delta \mathrm{H}$ for the chocolate bar.

Value
$4 \% \quad 53 .(b)$ A mixture of 125.0 g of an unreactive metal and 250.0 g of water has a temperature of $25.0^{\circ} \mathrm{C}$. The mixture is heated to a final temperature of $70.0^{\circ} \mathrm{C}$. Calculate the specific heat capacity of the metal if the mixture absorbs 49.7 kJ of heat.
$1 / 2$ mark $\quad \Delta \mathrm{T}=70.0^{\circ} \mathrm{C}-25.0^{\circ} \mathrm{C}=45.0^{\circ} \mathrm{C}$

```
\(q\) (absorbed) \(=-q\) (gain)
            \(=-\left[\mathbf{q}_{\text {metal }}+\mathbf{q}_{\text {water }}\right]\)
\(-49.7 \mathrm{~kJ}=-\left[\left(125.0 \mathrm{~g} \times \mathrm{c} \times 45.0^{\circ} \mathrm{C}\right)+\left(250.0 \mathrm{~g} \times 4.184 \mathrm{~J} / \mathrm{g}^{\circ} \mathrm{C} \times 45.0^{\circ}\right)\right]\)
\(-49700 \mathrm{~J}=-[(562(5) \times \mathrm{c})+470(70)]\)
\(-49700 \mathrm{~J}=-562(5) \mathrm{c}-470(70)\)
```

1 mark $\quad q$ (absorbed) side
2 marks $\quad-q$ (gain) side
$1 / 2$ mark $\quad c=\frac{-49700 \mathrm{~J}+470(70)}{-562(5)}=\frac{-26(30)}{-562(5)}=0.47 \mathrm{~J} / \mathrm{g}^{\circ} \mathrm{C}$

## Common Errors

Students:

- added masses together and solved for ' $c$ '.
- set $\mathrm{q}_{\text {metal }}=-\mathrm{q}_{\text {water }}$, and then solved for $\mathrm{c}_{\text {metal }}$.
- calculated $\Delta \mathrm{T}$ incorrectly.
- did not calculate $\Delta \mathrm{T} \ldots$ used $25^{\circ} \mathrm{C}$ for the metal and $70^{\circ} \mathrm{C}$ for the water.
- used 125.0 g as the mass of water.
- did not recognize that both the metal and the water absorbed energy.

Value
$5 \% \quad$ 53.(c) A 2.50 g sample of water is cooled from $95.0^{\circ} \mathrm{C}$ to $0.00^{\circ} \mathrm{C}$ and is completely frozen.
i) Draw the cooling curve for this process.

1 mark

ii) Calculate the energy released by the water sample.

1 mark $\quad q_{1}=\mathrm{mc}_{\text {water }} \Delta \mathrm{T}=(\mathbf{2 . 5 0} \mathrm{g})\left(4.184 \mathrm{~J} / \mathrm{g} \cdot{ }^{\circ} \mathrm{C}\right)\left(0.00^{\circ} \mathrm{C}-95.0^{\circ} \mathrm{C}\right)=-993 .(7) \mathrm{J}$

1 mark

$$
q_{2}=n \Delta H^{\circ}{ }_{\text {solid }}=\frac{2.50 \mathrm{~g}}{18.02 \mathrm{~g} / \mathrm{mol}} \times-6.02 \mathrm{~kJ} / \mathrm{mol}=-0.835(2) \mathrm{kJ}
$$

1 mark $\Delta \mathrm{E}_{\text {total }}=-$ 993.(7) $\mathbf{J}+(-835 .(2) \mathrm{J})=-1829 \mathrm{~J}$

## Science Communication $1 / 2$ mark units $1 / 2$ mark significant figures

## Common Errors

## 53.(c) part i)

Students:

- showed too many energy changes.
- adding in a boiling point and/or melting point at $25^{\circ} \mathrm{C}$.
- drew a curve as if it was a reaction mechanism.
53.(c) part ii)

Students:

- did not convert one of the calculated ' $q$ ' values from kJ to J (or vice versa).
- performed sign errors; all values were not negative.
- calculated only one of the energy changes (either the temp change or phase change).
- used $40.7 \mathrm{~kJ} / \mathrm{mol}$ instead of $6.02 \mathrm{~kJ} / \mathrm{mol}$ for $\Delta \mathrm{H}$.
- did not use the addition rule for significant figures correctly; science communication mark.

Value
$2 \% \quad 53$.(d) Calculate the enthalpy change for the reaction below.

$$
3 \mathrm{NO}_{2}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{O}(\ell) \quad \rightarrow 2 \mathrm{HNO}_{3}(\ell)+\mathrm{NO}(\mathrm{~g})
$$

| Substance | $\Delta \mathrm{H}_{\mathrm{f}}{ }^{\circ}(\mathrm{kJ} / \mathrm{mol})$ |
| :---: | :---: |
| $\mathrm{HNO}_{3}(\ell)$ | -174.1 |
| $\mathrm{H}_{2} \mathrm{O}(\ell)$ | -285.8 |
| $\mathrm{NO}(\mathrm{g})$ | 91.3 |
| $\mathrm{NO}_{2}(\mathrm{~g})$ | 33.2 |

```
\(\Delta H=\Sigma n \Delta H_{f}{ }^{\circ}\) (products) \(-\Sigma \mathbf{n} \Delta H_{f}{ }^{\circ}\) (reactants)
    \(=[(2 \mathrm{~mol} \times-174.1 \mathrm{~kJ} / \mathrm{mol})+(1 \mathrm{~mol} \times 91.3 \mathrm{~kJ} / \mathrm{mol})]\)
1 mark \(-[(3 \mathrm{~mol} \times 33.2 \mathrm{~kJ} / \mathrm{mol})+(1 \mathrm{~mol} \times-285.8 \mathrm{~kJ} / \mathrm{mol})]\)
    \(=[-348.2+91.3]-[99.6 \mathrm{~kJ}+(-285.8)]\)
    \(=[-256.9]-[-186.2]\)
1 mark \(=-70.7 \mathrm{~kJ}\)
```

## Common Errors

Students:

- used the bond energy equation instead of molar enthalpy of formation equation.
- did not multiply the $\Delta \mathrm{H}_{\mathrm{f}}{ }^{\circ}$ value by the molar coefficient.
- multiplied reactant and/or product values together instead of adding.

Value
$4 \% \quad$ 54.(a) Balance the redox reaction below under basic conditions.

$$

## Common Errors

Students:

- did not change minutes to seconds.
- did not calculate the number of moles of Cr from the mass.
- let moles of $\mathrm{Cr}=$ moles of electrons.
- did not recognize that the question asked for ion charge, not 'Q'.

Value
3\%
54.(c) Give the overall cell reaction and calculate the standard cell potential for the cell below.

$\mathbf{A g}^{+}+\mathbf{e}^{-} \rightarrow \mathbf{A g}$
$\mathrm{Cd}^{2+}+2 \mathrm{e}^{-} \rightarrow \mathbf{C d}$
$\mathbf{x} 2\left[\mathbf{A g}^{+}+\mathbf{e}^{-} \rightarrow \mathbf{A g}\right.$
$\mathbf{C d} \rightarrow \mathrm{Cd}^{2+}+2 \mathrm{e}^{-}$
$2 \mathrm{Ag}^{+}+\mathbf{C d} \rightarrow 2 \mathrm{Ag}+\mathrm{Cd}^{2+}$

1 mark
$\mathrm{E}^{\circ}=+\mathbf{0 . 8 0} \mathrm{V}$
$\mathrm{E}^{\circ}=\mathbf{- 0 . 4 0} \mathrm{V}$ (make ox for spontaneous rxn)
$\mathrm{E}^{\circ}=+\mathbf{0 . 8 0} \mathrm{V}$
$\mathbf{E}^{\circ}=+\mathbf{0 . 4 0} \mathrm{V}$
$\mathbf{E}^{\circ}{ }_{\text {cell }}=1.20 \mathrm{~V}$

1 mark

Science Communication $1 / 2$ mark units $1 / 2$ mark significant figures

## Common Errors

Students:

- appeared to choose Ag as the anode because it was on the left of the diagram; confusing it with cell notation.
- did not write half reactions, thus did not balance electrons correctly to have an overall balanced reaction.
- did not write the overall reaction.
- did not have 3 significant figures (ie: 2 decimal places) for final answer.
- did not include units in final answer.

CHEMISTRY 3202 ITEM ANALYSIS
SELECTED RESPONSE (PART I)

| Item | Answer | Responses |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
