\text{C}(\text{s}) + \text{O}_2(\text{g}) & \rightarrow \text{CO}_2(\text{g}) & \Delta H = -393.5 \text{ kJ/mol} \quad (1\text{ mark}) \\
2 \text{H}_2(\text{g}) + \text{O}_2(\text{g}) & \rightarrow 2 \text{H}_2\text{O}(\text{g}) & \Delta H = -483.6 \text{ kJ/mol} \quad (1\text{ mark})

\[
\text{CH}_4(\text{g}) + 2 \text{O}_2(\text{g}) \rightarrow \text{CO}_2(\text{g}) + 2 \text{H}_2\text{O}(\text{g}) & \Delta H_{\text{comb}} = -802.5 \text{ kJ/mol} \quad (1\text{ mark})

\[
n = \frac{25.0 \text{ g}}{16.05 \text{ g/mol}} = 1.56 \text{ mol} \\
q = n \Delta H = (1.56 \text{ mol}) \times (-802.5 \text{ kJ/mol}) = -1250 \text{ kJ} \quad (\frac{1}{2}\text{ mark})

2% (e) Explain, using appropriate equations, why $\text{HCO}_3^-(\text{aq})$ is considered amphoteric?

Typo: should be $\text{HCO}_3^-$

Amphoteric means $\text{HCO}_3^-$ can act as an acid (donate a proton) or as a base (accept a proton) \(1\text{ mark}\)

As an acid: $\text{HCO}_3^-(\text{aq}) + \text{OH}^-(\text{aq}) \rightarrow \text{H}_2\text{O}(\text{l}) + \text{CO}_3^{2-}(\text{aq}) \quad (\frac{1}{2}\text{ mark})$

As a base: $\text{HCO}_3^-(\text{aq}) + \text{H}_3\text{O}^+(\text{aq}) \rightarrow \text{H}_2\text{O}(\text{l}) + \text{H}_2\text{CO}_3(\text{aq}) \quad (\frac{1}{2}\text{ mark})$
53. (b) Explain kinetic and potential energy changes that occur in zinc as it is being warmed from 200 °C to 700 °C. (melting point of Zn = 420 °C, boiling point of Zn = 907 °C)

\[
\begin{align*}
\text{Zn (s)} & \rightarrow \text{Zn (s)} \\
200^\circ\text{C} & \rightarrow 420^\circ\text{C} \quad \text{PE constant; KE increases}
\end{align*}
\]

\[
\begin{align*}
\text{Zn (s)} & \rightarrow \text{Zn (l)} \\
420^\circ\text{C} & \rightarrow 420^\circ\text{C} \quad \text{PE increases; KE constant}
\end{align*}
\]

\[
\begin{align*}
\text{Zn (l)} & \rightarrow \text{Zn (l)} \\
420^\circ\text{C} & \rightarrow 700^\circ\text{C} \quad \text{PE constant; KE increases}
\end{align*}
\]

53. (c) 1.26 g of benzoic acid, \( \text{C}_6\text{H}_5\text{COOH(s)}(\Delta H_{\text{comb}} = 3225 \text{ kJ/mol}) \), is burned in a bomb calorimeter. The temperature of the calorimeter and its contents increases from 23.62 °C to 27.14 °C. Calculate the heat capacity of the calorimeter.

\[
\begin{align*}
n & = \frac{m}{M} = \frac{1.26 \text{ g}}{122.13 \text{ g/mol}} = 0.0103 \text{ mol} \\
\end{align*}
\]

\[
\begin{align*}
\Delta H_{\text{comb}} & = n \Delta H_{\text{comb}} \\
& = (0.0103 \text{ mol})(-3225 \text{ kJ/mol}) \\
& = -33.4 \text{ kJ} \\
\end{align*}
\]

\[
\begin{align*}
\Delta T & = (C_{\text{cal}})(27.14^\circ\text{C} - 23.62^\circ\text{C}) \\
& = (C_{\text{cal}})(3.52^\circ\text{C}) \\
& = -33.4 \text{ kJ} \\
\end{align*}
\]

\[
\begin{align*}
C_{\text{cal}} & = \frac{-33.4 \text{ kJ}}{-3.52^\circ\text{C}} = 9.45 \text{ kJ}^\circ\text{C} \\
\end{align*}
\]

53. (d) Give two reasons why a bomb calorimeter is a better instrument than a soft drink can for determining enthalpies of reaction.

(a) (i) Draw a diagram of the cell represented by \( \text{Cr(s)} | \text{Cr}^{2+}(aq) || \text{Pb}^{2+}(aq) | \text{Pb(s)} \). Label the following: anode, cathode, direction of electron flow, direction of ion flow, and the salt bridge.

(ii) What is the balanced redox reaction occurring in (i) above?

\[
\text{Cr(s)} + \text{Pb}^{2+}(aq) \rightarrow \text{Cr}^{2+}(aq) + \text{Pb(s)}
\]

(iii) What is \( E^\circ \) for this cell?

\[
\begin{align*}
\text{Cr(s)} & \rightarrow \text{Cr}^{2+}(aq) + 2e^- \quad E^\circ = +0.91 \text{ V} \\
\text{Pb}^{2+}(aq) + 2e^- & \rightarrow \text{Pb(s)} \quad E^\circ = -0.13 \text{ V} \\
\epsilon_{\text{cell}} & = +0.78 \text{ V}
\end{align*}
\]

(b) What current must be applied to an electrolytic cell, containing a solution of \( \text{NiCl}_2(aq) \), to produce \( 1.50 \times 10^4 \text{ g} \) of pure \( \text{Ni(s)} \) in 24 hours?

\[
\begin{align*}
n (\text{Ni}) & = \frac{m}{M} = \frac{1.50 \times 10^4 \text{ g}}{58.71 \text{ g/mol}} = 256 \text{ mol} \\
\text{n (e^-) } & = 256 \text{ mol Ni} \times \frac{2 \text{ mol e^-}}{1 \text{ mol Ni}} = 512 \text{ mol e^-} \\
Q & = n \times F = (512 \text{ mol e^-}) (96500 \text{ C/mol e^-}) = 4.94 \times 10^7 \text{ C} \\
I & = \frac{Q}{t} = \frac{(4.94 \times 10^7 \text{ C})}{(24 \text{ h} \times 3600 \text{ s/h})} = \frac{(4.94 \times 10^7 \text{ C})}{86400 \text{ s}} = 572 \text{ A}
\end{align*}
\]
