## Introduction

One of the goals of the Health Workforce Planning Division is to provide policy makers stakeholders with information about the supply and distribution of the health workforce in Newfoundland and Labrador (NL). In collaboration with the Regional Health Authorities (RHAs), the Health Workforce Planning Division conducts a bi-annual survey of health workforce vacant positions by profession, excluding physicians. This report focuses on data collected on October 1, 2015, and includes previously unreleased data for October 2014 and April 2015, as well as historical trending of vacant positions data. The number of vacant positions is collected as a point-in-time statistic meaning that RHAs submit only those positions that are vacant on a specified date of collection, rather than a summation of all vacant positions over the entire period.

## Methodology

The Health Human Resource Information System (HHRIS) is used for collecting vacancy data and has created greater consistency in recording and reporting of RHA vacancies. Standardized reporting using the HHRIS began in October 2013, which presents some challenges when comparing data to reports submitted prior to this date. For example, casual registered nurse vacancies had been excluded in previous reports due inconsistencies in the way RHAs were recording vacancies. This report will attempt to address any significant discrepancies or variations that are thought to be as a result of this change.

The vacancy data collected from the RHAs is summarized in this report in two sections:

- Registered Nurse Vacant Positions; and,
- Health Occupation Vacant Positions.

The HHRIS allows RHAs to accurately report the number of days that a position has been under recruitment. This indicator can be used as a general measure of recruitment difficulty; however, it is noted that there may be other factors, unrelated to recruitment difficulty, for delays in filling a position. There are numerous other indicators that could also determine whether a position is difficult-to-fill that are beyond the scope of this report including turnover, location, education requirements and workforce demographics. Further information on vacancies collection, including definitions, is available in the Methodological Notes section.

## What do Health System Vacancies mean to Newfoundland and Labrador?

The health workforce represents a large employment sector in NL. The RHA workforce in our province is a skilled and dedicated group of just over 19,000 individuals, representing eight per cent of the entire provincial workforce of $238,600^{1}$ people. These people form the teams that

[^0]provide quality healthcare services for the people of NL , from routine blood tests to complicated surgery.

Health services have created strong demand for health professionals across the province. Though not the only labour market indicator, the number of vacancies is one measure of whether an occupation is facing increased demand and/or decreased supply.

## Section 1: Registered Nurse Vacant Positions

Registered Nurse (RN) vacancies include all vacant RN positions in a RHA, regardless of whether the position is being advertised to internal employees of the organization only, external to the public, or if the position has not been posted for recruitment. RN vacancies include permanent, temporary, and casual positions; however casual position data was not reported consistently prior to the implementation of the HHRIS in October 2013. For the purpose of historical comparison, casual data will be analyzed separately where appropriate.

## Current Status:

In October 2015, the number of vacant RN bargaining unit positions posted internally and externally, including all employment types (i.e. permanent full-time, casual, etc.), was 330. Approximately 70 per cent, or 232 positions, were posted externally, while 30 per cent, or 98 positions, were posted internally. Acknowledging the constant internal movement of employees, policy makers are primarily concerned with the number of RN vacancies that have been posted for candidates external to the RHA.

As demonstrated in Figure 1, of the 232 positions posted externally, 62.9 per cent were casual (146 positions), 18.5 per cent were temporary full-time ( 43 positions), 16.8 per cent were permanent full-time ( 39 positions), 0.9 per cent were permanent part-time ( 2 positions) and 0.9 per cent were temporary part-time ( 2 positions).

Figure 1. Percentage of RN External Vacancies by Employment Type, October 2015.

Figure 2 demonstrates the number of external, non-casual postings over time. Casual positions were not consistently reported prior to October 2013 and have been excluded from this figure for comparison purposes.

Figure 2. External RN Non-Casual Vacancies, 2008-2015

As of October 2015, the number of external non-casual vacancies for RN positions (86) was approximately 75 per cent less than at its peak of 351 in April 2009. Recruitment incentives, such as bursaries and signing bonuses, as well as negotiated increases to compensation and benefits have improved RN recruitment and retention over the past seven years.

There are several trends developing in the number of casual RN vacancies (see Figure 3) now that RHA reporting processes are becoming standardized. First, there is a cyclical pattern between October and April reporting periods that coincides with RHA recruitment activity, which typically peaks in the spring. Second, there is an upward trend in the overall number of casual vacancies per reporting period, which has increased by 143 per cent since October 2013. Lastly, when comparing data on an annual basis, the proportion of casual vacancies has grown from 52 per cent to 63 per cent for October reporting periods, while remaining stable at 65 per cent for April reporting periods. Caution is recommended in drawing conclusions about these trends without considering the following:

- Standardized reporting of casual vacancies started in October 2013; however RHAs have been refining how positions are recorded in the HHRIS over time. It is difficult to determine if these trends are a result of improved reporting or other factors.
- Casual RNs are not obligated to accept shifts when called, nor is the employer obligated to call a casual RN when a shift is available, therefore casual vacancies cannot be measured or compared in terms of full-time equivalent (FTE) hours.
- Casual RN needs are often estimated by managers at a point in time, but recruitment requests are not always actively reviewed or cancelled if no longer needed.

Figure 3. External RN Vacancies, 2013-2015

The number of casual RN vacancies tends to vary in each RHA. In October 2015, 72 per cent of RN external recruitment postings in Eastern Health were casual positions compared to 30 per cent in Western Health. Eastern Health's requirements are influenced by its larger workforce, the nature of working in tertiary care settings, growth factors, waitlist reduction initiatives, and the need for workforce replacements. Casual employees may work significantly less than full-time hours.

The 232 external vacant RN positions in October 2015 included 127 in Eastern Health (eight permanent), 71 in Central Health ( 20 permanent), 10 in Western Health (three permanent), and 24 in Labrador-Grenfell Health (10 permanent). These 232 postings included 25 nurse practitioner positions: 7 in Eastern Health, 4 in Central Health, 4 in Western Health and 10 in Labrador-Grenfell Health. The majority of nurse practitioner vacancies (18 positions, or 72 per cent) were located in rural or remote areas, however there were a number of positions located in larger centres such as St. John's (two positions), Gander (two positions), Grand Falls-Windsor (two positions) and Corner Brook (one position). The average vacancy period for RNs (including nurse practitioners) was 206 days, (almost seven months). Nurse practitioner positions take longer to recruit than all other RN position categories, averaging 324 days in October 2015.

Of the 127 external recruitment postings in Eastern Health, 78 were located in St. John's metro area hospitals, long term care facilities and community care programs. The remaining positions were located in rural areas outside the St. John's metro area, most notably 11 positions at Carbonear General Hospital and five positions at the Harbour Lodge Nursing Home in

Carbonear. Of the eight external postings for permanent positions at Eastern Health, two were located in St. John's, three in Bonavista, two in Carbonear, and one in Burin.

In Central Health, 68 per cent of the 71 vacancies were located in Gander ( 23 positions) and Grand Falls-Windsor (24 positions). The remaining positions were located in rural areas, most notably six positions at in Springdale. Of the 20 external postings for permanent positions in Central Health, there were 10 in Gander, five in Grand Falls-Windsor, two in Springdale, two in New-Wes-Valley and one in Belleoram.

Western Health reported ongoing recruitment for two longstanding permanent full-time nurse practitioner vacancies; one in Ramea and one in Port Saunders. Both positions are considered difficult-to-fill and have been outstanding for multiple years. Western Health has not been successful in recruiting candidates to these positions, despite various recruitment incentives being approved, including bursaries, signing bonuses and other market adjustments. Of the remaining eight vacancies at Western Health, three were located in Corner Brook, three in Stephenville, and two in Rocky Harbour.

Labrador-Grenfell Health had 24 vacant RN bargaining unit positions in October 2015, with the largest number of vacancies located in St. Anthony (seven positions), followed by four positions in Happy Valley - Goose Bay, three positions in Labrador City, and the remainder dispersed throughout various community clinics. Of the 10 external postings for permanent positions, four were located in St. Anthony, two in happy Valley - Goose Bay, one in Labrador City, and the remainder in various community clinics.

RHAs indicated that 63 per cent of external RN postings in October 2015 were for relief pool replacements, followed by 14 per cent for internal transfers, 10 percent for new positions, five per cent for resignations, four per cent for maternity leave replacements and four per cent for other reasons. As demonstrated in Figure 4, there is a noticeable jump in the percentage of postings for relief positions, starting in October 2013. This coincides with the introduction of standardized reporting using the HHRIS and the inclusion of casual RN vacancies in the reports.

Figure 4. Reasons for External RN Recruitment Postings, 2008-2015

Due to past nursing shortages and movement to a more interdisciplinary team environment, management positions historically filled by RNs may be offered to individuals with other health occupation backgrounds and may no longer be considered only RN positions. All vacant management positions in RHAs are collected in Section 2: Health Occupation Vacant Positions

## Tables:

Further detail on RN vacant positions is given in Annex A. Reports are grouped according to classification as follows:

| Report | Description | Page |
| ---: | :--- | :---: |
| Report 1 - A | RHA / Sector / Facility / Posting Type | 19 |
| B | RHA / Employment Type / Sector / Posting Type | 25 |
| C | RHA / Employment Type / Facility / Posting Type | 31 |
| D | RHA / Times Series | 40 |
| E | RHA / Vacancy Reason / External Recruitment Postings | 41 |

## Section 2: Health Occupation Vacant Positions

For the purpose of this report, health occupation vacant positions refers to all vacancies in RHAs, other than physicians and RNs. This includes positions that are permanent, temporary and casual/temporary call-in (TCI), and posted for both internal and external recruitment. Similar to RN vacancies, there has been inconsistent casual/TCI data reported prior to the implementation of HHRIS in October 2013, due to lack of standardized process for recording these vacancies in RHAs. Data will be analyzed separately where appropriate.

Health occupation vacancies are grouped into three main categories: primary occupations, ancillary-clinical occupations and ancillary-support occupations. Definitions are provided in the Methodological Notes section.

## Current Status:

In October 2015, the number of vacant health occupation positions posted internally and externally, including all employment types (i.e. permanent full-time, casual, etc.), was 681. Approximately 73 per cent, or 495 positions, were posted externally, while the remaining 27 per cent, or 186 positions, were posted internally. The analysis in this section will focus on external vacancies only; internal recruitment postings represent movement within the organization and are not included. It is also possible that a position may be vacated for a period of time due to illness / injury / other leave, and the RHA will not advertise the position externally. Rather, the RHA may choose to backfill the position with relief staff or overtime.

Approximately 54 per cent of all external vacancies were casual/TCI ( 270 positions), followed by 26 per cent temporary full-time ( 127 positions), 13 per cent permanent full-time ( 65 positions), four per cent permanent part-time ( 18 positions) and three per cent temporary parttime (15 positions).

Figure 5. Percentage of External Health Occupation Vacancies by Employment Type, October 2015.

Over the past six years, there has been considerable fluctuation in the number of external, noncasual/TCI health occupation vacancies in RHAs (Figure 6). Overall, the number of vacancies has decreased from 386 in October 2008 to 225 in October 2015. Some factors which have had an impact on vacancy levels in recent years include changes to models of care, operational reviews and opening of new facilities. On average, there have been 245 vacancies reported per collection period since October 2008.

Figure 6. External Non-Casual/TCI Health Occupation Recruitment Postings, 2008-2015

Eastern Health continues to report the highest proportion of external, non-casual/TCI, vacancies. In October 2015, vacancies at Eastern Health represented 69 per cent ( 156 positions) of all noncasual/TCI vacancies, followed by Central Health at 14 per cent (31 positions), LabradorGrenfell Health at 10 per cent ( 23 positions) and Western Health at seven per cent ( 15 positions).

Total non-casual/TCI vacancies have decreased for three consecutive periods and were below average for both April and October 2015.

Total casual/TCI vacancies have also been trending downwards since April 2014; however similar to casual RN vacancies, a cyclical pattern is apparent between October and April reporting periods. Casual/TCI health occupation vacancies tend to increase in the April reporting periods as RHAs begin to hire large numbers of staff for summer relief.

Figure 7. External Health Occupation Vacancies, 2013-2015.

Despite the general decrease in vacancies overall, RHAs are continuing to experience above average vacancies for several occupations, including licensed practical nurses (LPN), personal care attendants (PCA), trades workers, laboratory technologists and psychologists. Furthermore, occupations such as LPNs, social workers, dietitians and paramedics all experienced increases from April 2015 to October 2015.

## Primary Occupations:

In the primary occupations category, 229 positions were posted for external recruitment in October 2015; 46 per cent of these postings were temporary full-time, followed by 30 per cent casual/TCI, 17 per cent permanent full-time and 3.5 per cent each for permanent part-time and temporary part-time. This is a change in the distribution of positions by employment type from previous collection periods; casual/TCI positions have typically represented the highest proportion of vacancies, followed by permanent full-time and temporary full-time positions. This change is primarily due to an increase in non-TCI LPN vacancies, which has increased from 18 in October 2013 to 86 in October 2015. As per Figure 8, non-TCI LPN postings have been on an upwards trend since October 2012, with vacancies in the past three reporting periods all exceeding the previous peak of 51 in October 2008. Historically, LPN vacancies have been predominantly TCI; however, in an effort to improve recruitment and retention, Eastern Health began converting many of its TCI positions to temporary full-time in the fall of 2014.

Figure 8. External Non-TCI LPN Vacancies 2008-2015

In total, RHAs reported 130 LPN vacancies in October 2015, or 26 per cent of all external health occupation vacancies. Eastern Health had the highest number of LPN vacancies at 90, followed by 36 in Central Health, three in Western Health, and one in Labrador-Grenfell Health. Of the 130 LPN postings, 64 per cent were for temporary positions, 34 per cent were for TCI positions and two per cent were for permanent positions.

Figure 9. External LPN Vacancies 2008-2015

RHAs also reported 22 postings for management positions in October 2015, which has steadily declined from 64 postings in April 2014. Approximately 59 per cent of management vacancies
were permanent full-time positions. Three RHAs reported external management recruitment postings including 19 positions in Eastern Health, two positions in Western Health and one position in Labrador-Grenfell Health. Management positions are paid on the HL scale, and include both clinical and non-clinical managers.

External recruitment postings for diagnostics professionals decreased overall between April 2015 and October 2015; however a number of positions continue to be difficult-to-fill. In October 2015, there were 20 external recruitment postings for medical laboratory technologist positions, down from 26 in April 2015. 50 per cent of the positions posted were TCI, while temporary fulltime and permanent full-time and made up 35 and 15 per cent respectively. There were six positions for medical radiation technologists in October 2015, which is no change from April 2015. 50 per cent of the positions were TCI, 33 per cent were temporary full-time and 17 per cent were permanent full-time. There were also external postings for six combined laboratory/xray technologist positions, three cardiology technologists, and one electroneurophysiology technologists.

External vacancies for clinical psychologists have decreased from 14 in April 2015 to 13 in October 2015; however vacancies have increased overall in the past three reporting periods. 77 per cent of clinical psychologist vacancies were permanent positions, and 23 per cent were temporary. Enhanced recruitment incentives, such as bursaries and signing bonuses have been approved to support RHAs in their efforts to fill longstanding vacancies.

The average vacancy period for primary occupations increased from 199 days to 253 days, or approximately eight months. Vacancies for clinical psychologists, electroneurophysiology technologists, combined laboratory/x-ray technologists and orthopaedic technologists all have average vacancy periods of one year or more. Incentives have been used successfully to fill vacancies in health professional groups over the past few years such as bursaries, signing bonuses and salary continuance. It is expected that continuation of incentives will help in recruiting and retaining health professionals.

## Ancillary-Clinical Occupations:

There were 158 external recruitment postings for ancillary-clinical positions in RHAs, including 86 PCA positions, 49 of which were in Eastern Health. The number of PCA vacancies has decreased significantly from 255 positions in April 2015, the highest number ever recorded. The majority ( 80 per cent) of the 86 PCA postings were for TCI positions, 12 per cent were for permanent positions, and eight per cent were for temporary positions. The general increase in demand for these positions over the past two years is primarily due to changes in the model of nursing care, and ongoing recruitment needs resulting from the opening of new facilities. There is also a noticeable spike in PCA vacancies during April reporting periods; this coincides with when RHAs typically hire large numbers of nursing students for the upcoming summer relief period.

Figure 10. Total External PCA Vacancies 2013-2015

Child and youth care workers represented the second largest group of vacancies in the ancillary clinical category with 25 positions, which is an increase of 10 from April 2015. 92 per cent of the postings were for TCI positions, and eight percent were temporary. Central Health had the highest number of vacancies with 21 positions, resulting from a new youth treatment facility and services in Grand Falls-Windsor.

The average vacancy period for ancillary-clinical occupations increased from 104 days in April 2015 to 187 days in October 2015, which is approximately six months.

## Ancillary-Support Occupations:

The ancillary-support category, which includes occupation groups such as administration, dietary, facilities/skilled trades, housekeeping and laundry saw a decrease in postings from 215 in April 2015 to 108 in October 2015 and has been on a downward trend since a recent peak of 332 in April 2014. 62 per cent of external recruitment postings came from two main occupation groups: administration ( 31 per cent) and facilities/skilled trades ( 31 per cent). Other notable groups include materials ( 13 per cent) and housekeeping (eight per cent). TCI positions continue to make up the majority of vacancies in this category for October 2015 at 62 per cent, compared to 20 percent permanent and 18 per cent temporary.

Vacancies in facilities/skilled trades occupations decreased from 39 in April 2015 to 34 in October 2015 and have also been on a downward trend from 43 positions in April 2014. Half of the positions reported in October 2015 were permanent, 29 per cent were TCI and 21 per cent were temporary.

The average vacancy period for ancillary-support occupations increased from 135 days in April 2015 to 241 days in October 2015 (eight months).

## Reasons for Vacancies

The top reasons for vacancies included relief pool replacement ( 62 per cent), internal transfers ( 12 per cent), resignations (seven per cent), new positions (six per cent), retirements (four per cent) and maternity leaves (four per cent). Further analysis by reason for vacancy is provided in Table 1.

Table 1. Reason for Health Occupation Vacancy - October 2014

| Reason for Vacancy | Number of Vacant Positions | Percentage of Vacant Positions |
| :--- | :---: | :---: |
| Relief | 306 | $62 \%$ |
| Internal Transfer | 60 | $12 \%$ |
| Resignation | 35 | $7 \%$ |
| New Position | 28 | $6 \%$ |
| Maternity Leave | 20 | $4 \%$ |
| Retirement | 20 | $4 \%$ |
| Leave of Absence | 8 | $2 \%$ |
| Other | 18 | $4 \%$ |
| Grand Total | $\mathbf{4 9 5}$ | $\mathbf{1 0 0 \%}$ |

## Tables

Further detail on external recruitment postings is given in Annex B. Reports are grouped according to classification as follows:

| Report | Description | Page |
| :--- | :--- | :---: |
| Report 2 - A | Occupation / RHA / Employment Type / Recruitment | 45 |
| B | Occupation / Time Series | 51 |
| C | Top 5 Reasons for Vacancy by Occupation | 53 |

## Methodological Notes

## Definitions

## Primary Occupations

Primary occupations provide direct patient care, diagnostic services, or manage the health system (including clinical and non-clinical managers). They also meet one or more of the following conditions: there exists a regulatory body and/or professional association, and/or their post-secondary educational background is generally in excess of a single year (i.e. technologist vs. technician). Examples include registered nurses, psychologists, medical laboratory technologists, and speech language pathologists.

## Ancillary Occupations - Clinical

These are individuals that do not fit the Primary Occupations category but may provide direct patient care or diagnostic services, and generally work under the direction of primary occupations. Examples include medical laboratory assistants, personal care attendants, and recreation therapy workers.

## Ancillary Occupations - Support

These are individuals that support the system. They do not fit the Primary Occupations or Ancillary Occupations - Clinical categories. Examples include laundry, dietary, housekeeping, and information systems staff.

## Casual or Temporary Call-In (TCI) Vacancies

A position that has no set schedule and employees are requested to work on an as-needed basis. Casual and temporary call-in employees provide relief for other employees on various types of leave and cover short-term / unpredictable increases in workloads. There may be a limited number of casual and temporary call-in employees available due to time of year, location, and expertise area.

- Casual: In the Registered Nurses' Union Newfoundland and Labrador (RNUNL) and Association of Allied Health Professionals (AAHP) collective agreements, these employees are called "casual." These employees have no obligation to the RHA to come when they are called and the RHA has no obligation to call any one particular employee.
- Temporary call-in: In the Newfoundland and Labrador Association of Public and Private Employees (NAPE) and Canadian Union of Public Employees (CUPE) collective agreements, these employees are called "temporary call-in." Temporary call-in employees are called to work in order of seniority. They are obligated to work
when called; seniority is forfeited if a temporary employee refuses to report for work at least three times when called.

## Permanent, Temporary, and Float Vacancies

A position that is available to another candidate because the previous incumbent has left the position or is on leave from the position for more than thirteen (13) weeks, or it is a new position. This does not include casual or temporary call-in vacancies.

A vacancy begins when the request to fill the vacancy (with all required approvals) is received in Human Resources. In previous reports, a vacancy was created when the position was posted. As a result of this change, the vacancy period, or number of days that a position has been vacant, may be longer than in previous iterations of this report.

## Point-in-Time

The number of vacant positions is collected as a point-in-time statistic meaning that RHAs submit only those positions that are vacant on a specified collection date, rather than a summation of all vacant positions over the entire period. The number of vacant positions is collected twice annually: April 1 and October 1, as well as trending of vacant positions data over time.

## Time of Year

The number of vacancies is volatile and can change on a daily basis. Changes are due to a number of factors:

- Time of year - more vacancies in spring and summer due to need for summer relief
- New government initiatives (for example, wait times)
- Skill mix changes
- Equipment changes or new equipment
- After a RHA has initiated a strategy to reduce workforce vacancies

April/May is the time of year when the majority of summer recruitment occurs, therefore the number of positions being recruited is usually higher than other times throughout the year. This is also the time when most students are finished their final exams, and although they do not graduate until May, RHAs will advertise and may hire students prior to graduation. Also, throughout fall and winter, as employees leave the organization, there is generally a small pool from which to recruit until new graduates are available in the spring.

## Posting Type

For the purposes of this report, vacancies are classified into two categories:

- External recruitment posting
- Posted internal only

External recruitment postings are the primary interest of policy makers as a measure of the number of individuals that need to be recruited external to the organization in order to fill vacant positions. In previous versions of the Health Workforce Vacant Position Report, external recruitment postings were divided into two categories: posted both internal and external, and posted external only. When an employee leaves an organization or moves to a new position, the vacant position is almost always posted for internal competition, as required by the collective agreement, before being posted for an external candidate. These vacancies were previously classified as posted both internal and external. In instances where a position is immediately advertised for an external candidate without having been posted internally, the vacancy was previously classified as posted external only. Starting in October 2010, external recruitment postings refer to all positions that were posted external to the RHA, regardless of whether they were initially posted for internal candidates.

There is, and always will be, internal movement within RHAs. Another employee may apply for and be accepted into the vacant position, causing another internal vacancy, etc. Because of the nature of internal postings, they cannot be considered explicitly as an indication of a need for additional, externally-supplied health professionals. It is also noted that vacancies may not be posted if the RHA decides not to fill a position due to budgetary constraints or program changes.

## Notes:

1. Vacancy data in April 2006 for Health and Community Services St. John's Region (as included under Eastern Health) was unavailable. Therefore, vacancies for Eastern Health and the resulting health system total vacancies may be understated, and caution should be noted.
2. Between October 2006 and April 2013, Western Health Care Corporation (as included under Western Health) only provided data on 'difficult to fill' positions for this quarter, and estimates for non- 'difficult to fill' vacancies were derived from external advertising sources. External advertising sources only provide information on vacant positions that may be filled by applicants external to the organization, and does not indicate any positions to be filled internally. Therefore, vacancies for Western Health and the resulting health system total vacancies may be understated, and caution should be noted.
