INTRODUCTION

A regional surficial geology mapping and till-sampling survey for the St. Julien's map area (NTS 2M/04) in western Newfoundland was completed during the 2018 and 2019 field seasons (Figure 1; Hashmi, 2020). This data release presents the analytical results for till samples collected in the map area as well as summary notes on the samples. A total of 19 B-horizon, C-horizon and BC-horizon till samples, weighing 2–3 kg, were collected, primarily along road cuts *via* truck, foot traverse, and all-terrain vehicles (ATVs), with sample collection dependent on the quality of till. Of these, 10 till samples were collected overlying and down-ice of the Sail Pond Ag–Cu–Pb–Zn–Sb prospect. The samples were collected using a shovel and geological pick. Quality control measures in the field included thorough cleaning of sampling equipment between sites to reduce cross-contamination, and written and photographic documentation at each site.

METHODS

SAMPLE PREPARATION

Initial till sample preparation was completed at the geochemical laboratory of the Geological Survey of Newfoundland and Labrador (GSNL). The samples were dried in a Hotpack® oven at 55°C, then gently crushed using a rubber mallet. The samples were then placed in a RO-TAP® to isolate the silt + clay (-63 µm) fraction for analyses. The >63 µm fraction was archived. The RO-TAP® was cleaned between each sample with ethanol and dried in the oven. Till samples were submitted to multiple laboratories for geochemical analyses. The detection limits, concentration units, maximum and minimum concentration, and the associated column header for each analysis in Appendices A and B are reported in Table 1. Quality assurance before sample submission for analyses consisted of insertion of lab duplicates to test analytical precision. The quality of the analyses has been verified prior to their release.

ANALYTICAL TECHNIQUES

The following analyses were completed at the GSNL laboratory and presented in Appendix A. A detailed description of each analytical procedure can be found in Finch *et al.* (2018).

- 1) Four-acid (hydrochloric acid, hydrofluoric acid, nitric acid and perchloric acid) digestion followed by inductively coupled plasma-optical emission spectrometry (ICP-OES) to determine concentrations of major and trace elements (Ag, Al, As, Ba, Be, Ca, Cd, Ce, Co, Cr, Cu, Dy, Fe, K, La, Li, Mg, Mn, Mo, Na, Nb, Ni, P, Pb, Rb, S, Sc, Sr, Ti, V, Y, Zn and Zr). This analysis is indicated by element suffix “2”. Note that Ag is digested by nitric acid and determined by ICP-OES and is indicated by element suffix “6”.
- 2) Alkaline fusion followed by ion-selective electrode (ISE) technique to determine fluoride ion (F-) and indicated by element suffix “9”.
- 3) Loss on ignition (LOI) *via* gravimetry to determine percentage of organic matter and written as “LOI”.

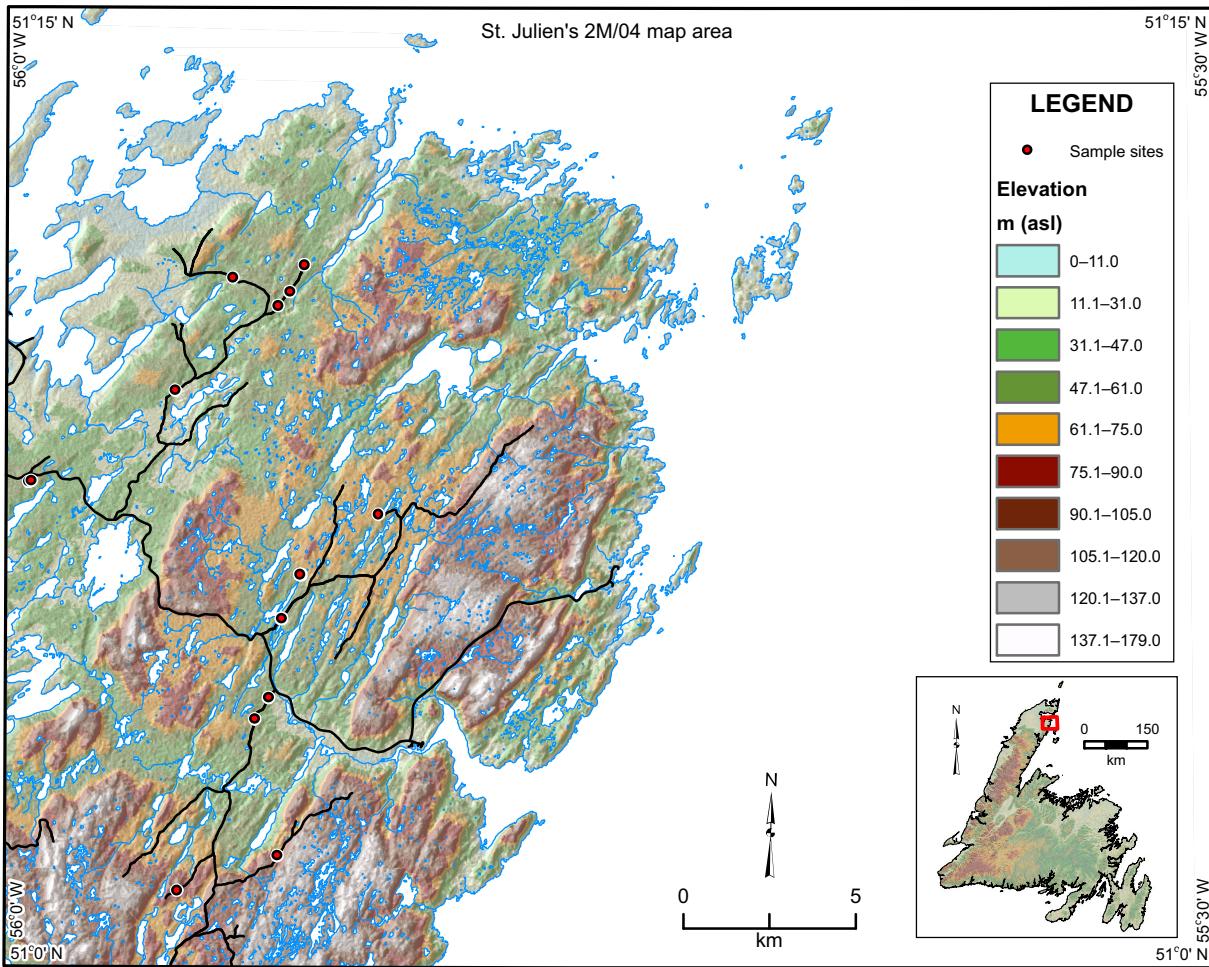

Figure 1. Till sampling sites from 2018 and 2019 field seasons in the St. Julien's map area (NTS map area 2M/04), underlain by topographic hill shade.

- 4) A 4-acid digest followed by ICP-MS to determine major and trace elements (Ag, As, Ba, Bi, Cd, Ce, Co, Cs, Cu, Dy, Er, Eu, Ga, Gd, Ge, Hf, Ho, La, Lu, Mo, Nb, Nd, Ni, Pb, Pr, Rb, Sb, Sc, Sm, Sn, Sr, Tb, Th, Tl, Tm, U, V, W, Y, Yb and Zn). This analysis is indicated by element suffix “30”.
- 5) Instrumental neutron activation analysis (INAA) at Bureau Veritas (BV) to determine concentrations of 27 elements (As, Au, Ba, Br, Ce, Co, Cr, Cs, Eu, Fe, Hf, La, Lu, Mo, Na, Rb, Sb, Sc, Se, Sm, Ta, Tb, Th, U, W, Yb and Zr).

The following analyses were completed at ALS Canada Ltd. and presented in Appendix B:

- 1) Fire assay followed by inductively couple plasma-atomic emission spectroscopy (ICP-AES) on a 50 g aliquot to determine Au content. This analysis is indicated by suffix “FA” in column header in Appendix B and abbreviated as “Au-ICP22” in the ALS schedule of fees (Appendix C).

- 2) *Aqua regia* digest on a 50 g sample, followed by inductively coupled plasma-mass spectrometry (ICP-MS) to determine the concentration of major and trace elements (Ag, Al, As, Au, B, Ba, Be, Bi, Ca, Cd, Ce, Co, Cr, Cs, Cu, Fe, Ga, Ge, Hf, Hg, In, K, La, Li, Mg, Mn, Mo, Na, Nb, Ni, P, Pb, Pd, Pt, Rb, Re, S, Sb, Sc, Se, Sn, Sr, Ta, Te, Th, Ti, Tl, U, V, W, Y, Zn and Zr). This analysis is indicated by element suffix “ST4” in Appendix B and as “AuME-ST44™” in the ALS schedule of fees (Appendix C).
- 3) A 4-acid digest on a 0.25 g aliquot, followed by ICP-MS to determine major and trace elements (Ag, Al, As, Ba, Be, Bi, Ca, Cd, Ce, Co, Cr, Cs, Cu, Fe, Ga, Ge, Hf, Hg, In, K, La, Li, Mg, Mn, Mo, Na, Nb, Ni, P, Pb, Pd, Pt, Rb, Re, S, Sb, Sc, Se, Sn, Sr, Ta, Te, Th, Ti, Tl, U, V, W, Y, Zn and Zr). This analysis was completed on the silt + clay sized fraction of 19 till samples and the clay sized fraction of one till sample. Note that the clay separation was completed at ALS. The analysis completed on the clay size fraction is indicated by element suffix “MS6” in Appendix B and as “ME-MS61™” in ALS Canada Ltd. 2022 geochemistry schedule of fees and services (Appendix C). Note that Hg by this method is indicated by element suffix “MS4” in Appendix B and “ME-MS42™” in Appendix C. The analysis completed on the silt + clay fraction is indicated by element suffix “MSL” in Appendix B and as “ME-MS61L™” in ALS schedule of fees (Appendix C).

Lastly, a 100 g aliquot was submitted to the Ontario Geological Survey’s Geoscience Lab (GeoLabs) for particle size analysis (PSA). This analysis is abbreviated as “PSA” in Appendix B.

RESULTS

The following information is presented in the data tables as comma separated value files (.csv) in Appendices A and B: sample number, year, location, elevation, horizon, depth, map unit, additional notes on location, and the elements analyzed. Major elements are reported in wt. %, whereas minor and trace elements are reported in ppm, unless otherwise specified. Negative values represent results below the reporting limit; “-9” indicates that a sample was not analyzed for that element. Different analytical procedures are indicated by suffixes; refer to Table 1 for a list of analytical methods for each element and associated abbreviations in column headers (*see above*). All location data is projected in Universal Transverse Mercator (UTM) easting and northing, zone 21, and the datum used is NAD 27.

ACKNOWLEDGMENTS

The following individuals are thanked for their efforts with the timely completion of the data release: Kim Morgan for cartography and GIS support, and Pauline Honarvar, Megan Reardon and Sara Jenkins for reviewing the database and report.
