

GRANULAR-AGGREGATE RESOURCES OF THE BATTEAU MAP AREA (NTS 3E/05)

OPEN FILE 3E/05/0009
MAP 2009-45

LEGEND

- Sample types (based on laboratory sieve analysis - see Table 1)
- | Sample Symbol | Definition |
|---------------|--|
| ○ | Commonly gravel or sand, having silt-clay content < 5 percent. Deposits are commonly graded and stratified. |
| ▲ | Commonly till, poorly graded and of variable grain size, having a silt-clay content, (> 5 and < 15 percent) and stone size exceeding allowable limits for most geotechnical purposes (except subgrade uses) without processing (i.e., washing, screening or crushing). |
| + | Commonly silty till, silt or clay samples, having silt-clay content > 15 percent. |

Multiple samples taken from the same site in different years are listed in order from oldest to youngest. Multiple samples taken at the same site in the same year are listed in order, from the top of the exposure to bottom.

Note
This is a composite legend for all granular-aggregate resource maps. All aggregate zones, study areas, and sample types shown in the legend may not appear on this map. Aggregate zone classification is based on airphoto interpretation, field investigation and sieve analyses. Areas outside the coloured zones have no known potential for granular materials; however silty tills, rock rubble suitable for fill, and bedrock suitable for aggregate may be present. Classification criteria used on this map do not consider current or conflicting land uses, nor do they guarantee either access to, or the quality of, the material located within these zones.

ZONES OF AGGREGATE POTENTIAL

- | | |
|--|--|
| | Contains granular materials; probability of locating economic deposits is moderate to high |
| | Contains thin (less than 2 m) or discontinuous granular materials; also includes areas where extent of thicker deposits could not be determined by field investigation; probability of locating economic deposits is moderate to low |
| | May contain granular materials but deposits are not substantiated by field investigation; probability of locating economic deposits is moderate to low |
| | Material of granular composition (e.g., sandy tills and colluvium) that generally contains up to 8 percent silt-clay content, but could be improved for higher grade uses by washing or screening |
| | Contains sand-size granular materials; high potential for economic exploitation of sand; low to moderate potential for coarser granular materials |
| | Eskers: sinuous ridges of granular materials; moderate to high potential for economic exploitation |
| | Study Area within the dashed outline |

In addition to this map data, a granular-aggregate database is accessible in the Geoscience Resource Atlas of Newfoundland and Labrador (<http://gis.geosurv.gov.nl.ca>) for all granular-aggregate maps and sample data. The database provides information on more than 15 000 samples collected from 230, 1:50 000-scale-map areas in Newfoundland and Labrador.

This map was originally produced in a series of blue-line maps from airphoto interpretation and field work (Ricketts, 1988).

The location of roads added to topographic map base are approximate.

Elevation in feet above mean sea level. Contour interval 20 feet.

Digital Cartography by T.J. Sears, Geological Survey, Department of Natural Resources, Government of Newfoundland and Labrador.

Copies of this map may be obtained from the Geoscience Publication and Information Section, Geological Survey, Department of Natural Resources, Government of Newfoundland and Labrador, P.O. Box 6700, St. John's, NL, Canada, A1B 4J6.

This map is subject to review and revision. Comments to the author concerning errors or omissions are invited.

Base from maps published by Surveys and Mapping Branch, Department of Natural Resources, Ottawa, Canada.
