

FIRST VERTICAL DERIVATIVE OF THE MAGNETIC FIELD

First Vertical Derivative of the Magnetic Field

This map of the first vertical derivative of the magnetic field was derived from data acquired during an airborne survey carried out by EON Geosciences Inc. (EON), from January 12 to February 13, 2019, with a Piper Cheyenne II aircraft (C-GFWB). The data were recorded using splitbeam carbon vapour magnetometers (sensitivity = 0.005 nT) mounted in each of the tail booms of these aircraft. The nominal traverse and control line spacings were, respectively, 200 m and 1200 m, and the aircraft flew at a nominal terrain clearance of 100 m. Traverse lines were oriented N35°E with orthogonal control lines. The flight path was recorded and post-processed using the Global Positioning System (GPS) and the video camera. The survey was flown on a pre-determined flight surface to minimize differences in magnetic values at the intersections of control and traverse lines. These differences were computer-analysed to obtain a mutually leveled set of flight-line magnetic data. The leveled values were then interpolated to a 50 m grid. The International Geomagnetic Reference Field (IGRF) model for the year 2018 was used to remove the IGRF-12 model (Year 2018-329) was then removed. Remnant of the IGRF representing the magnetic field of the Earth's core, produces a residual component related almost entirely to magnetizations within the Earth's crust.

The first vertical derivative of the magnetic field is the rate of change of the magnetic field in the vertical direction. Computation of the first vertical derivative removes long-wavelength features of the magnetic field and significantly improves the resolution of closely spaced and superimposed anomalies. A property of first vertical derivative maps is the coincidence of the zero-value contour with vertical contacts at high magnetic latitudes (Hood, 1965).

This publication is available for free download through GOSCAN (<http://geoscan.nrcan.gc.ca>). Corresponding digital profile and gridded data as well as similar data for adjacent airborne geophysical surveys are available through Natural Resources Canada's Aeromagnetic Data Repository for Aeromagnetic Data at <http://aer.vsg.nrcan.gc.ca/index.htm>. Digital products from this airborne survey are also available from the GSNL Geoscience Atlas at <http://geoscan.gov.ca/gsna/gsna.htm>.

**Acknowledgments**  
The field crew chiefs, Richard Bailey and Khorram Khan (EON), are thanked for their cooperation and their technical assistance during the start-up phase of this survey. We also thank Marc Richard (EON) for his cartographic design expertise.
