## SUMMARY

This data release consists of geochemical data from felsic volcanic rocks of the Nukliavik volcanic suite, which represents the intrusive component of the Mesoproterozoic Flowers River Igneous Suite in north-central Labrador. The geological context of these rocks and a description of their stratigraphy are contained in a report by Miller (1992a). All of the sampled locations lie within the 1:50 000 topographic map sheet 13N/11. This open file provides no attempt at interpretation of these data; its purpose is to place them in the public domain (Appendix A).

This forms a supplementary release to an earlier release of selected geochemical data by Miller (1992b), which contained locational data, scintillometer readings, and analytical results for Nb, Zr, Th, Y, La, Ce and Be. The present release includes these data, together with previously unreleased major element data, and previously unreleased results for other trace elements. All of these data were acquired in 1991 or 1992, at the same time as the data released by Miller (1992b). The data are tabulated below, and are also available in two common spreadsheet data formats, i.e., Microsoft Excel (\*.xls file) and Lotus 1-2-3 (\*.wk1 and \*.wk4 files). Brief descriptions of the samples are contained in the earlier release by Miller (1992b).

Major elements and most trace elements were analyzed by inductively-coupled plasma emission spectrometry (ICP-ES) methods. A small number of trace elements (Cr, Mo and Rb) were determined by atomic absorption (AA) methods, and fluorine was determined by ion-selective electrode (ISE) analysis. Note that there are two sets of results for the elements Zr and Ba. The results for Zr(1) and Ba(1) represent analyses from the major elements digestion, which uses a fusion method to ensure total dissolution of all phases. This is because zircon and barite may form an insoluble residue during the digestion of powdered sample used for most trace element analyses. Differences between values for these elements from different digestions may indicate the presence of these minerals in the samples. Note also that a negative value reported for a given element indicates that its concentration was below the detection limit.
