INTRODUCTION

This brief report provides uranium geochemical data for till samples collected over the Burin Peninsula in 2006. This is a limited data release in response to the active mineral exploration for uranium in this part of Newfoundland. No interpretation of the data is presented in this report. Full interpretations and statistical analysis of the data will be available when it is released in its entirety in 2008.

The reader is referred to Batterson and Taylor (2006) for background information on the area, and to McConnell (1984) for earlier sediment geochemistry data. Geochemical data plots are overlain on a bedrock geology map (Figure 1) derived from Colman-Sadd *et al.* (1990).

REGIONAL SURFICIAL SEDIMENT SAMPLING

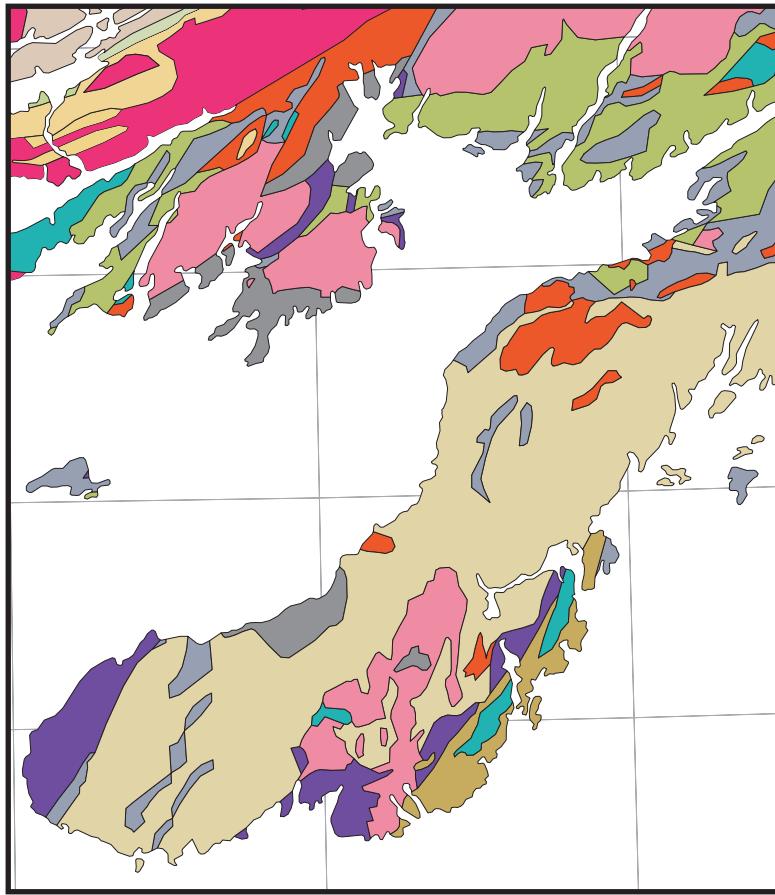

SAMPLING AND SAMPLE PREPARATION METHODS

A regional till sampling program was conducted using the surficial geology as a guide. Glaciofluvial, fluvial, marine, and aeolian sediments were not sampled. Most samples were from the C- or BC-soil horizon, taken at about 0.5 m depth in test pits, or 0.5 to 1.0 m depth in quarries or road cuts. In rare instances, the lack of surface sediment necessitated the sampling of bedrock detritus. Sample spacing was controlled by access as well as surficial geology, but was generally about 1 sample per 1 km² in areas of good access to 1 sample per 4 km² in areas where helicopter support was required. Duplicate field samples were collected from 28 sites. These data were used to determine data reproducibility. In the field, samples were placed in kraft-paper sample bags, and sent to the Geological Survey's Geochemical Laboratory in St. John's, where they were air-dried in ovens at 40°C and dry-sieved through 180 µm stainless steel sieves. A total of 748 samples (excluding field duplicates) were collected in the field (Figures 2 and 3).

GEOCHEMICAL ANALYSIS

Uranium was determined by instrumental neutron activation analysis (INAA) at Activation Laboratories Ltd., Ancaster, Ontario. On average 24 g of sample was used for analysis, and the samples (with duplicates and control reference materials included incognito) were weighed and encapsulated in the Geochemical Laboratory of the Department of Natural Resources in St. John's. Samples were irradiated with flux wires and an internal standard (1 for 11 samples) at a thermal neutron flux of 7×10^{11} n/cm²s. After 7 days (to allow Na²⁴ to decay), samples are counted on a high purity Ge detector with a resolution of better than 1.7 KeV. Using the flux wires, the decay-corrected activities are compared to a calibration developed from multiple certified international reference materials. The standard present is only a check on accuracy of the analysis and is not used for calibration purposes. Ten to thirty percent of the samples are checked by re-measurement.

A data listing of field and geochemical data is contained in Appendix A.

OVERLAP SEQUENCES

Devonian and Carboniferous

Non-marine sedimentary and volcanic rocks. Latter includes Grand Beach complex, and Rocky Ridge Formation on the Burin Peninsula.

Devonian

Granite. Includes Ackley granite (buff to pink, coarse-grained biotite granite), Red Island granite (pink, fine- to medium-grained, biotite granite), Bar Haven granite (pink, buff and grey, medium grained granite), Ragged Islands Intrusive Suite (pink, medium-grained granite) and St. Lawrence granite (pink to red, medium- to fine-grained riebeckite-aegirine granite).

Silurian

Posttectonic gabbro-syenite-granite-peralkaline granite suites and minor unseparated volcanic rocks.

DUNNAGE ZONE

Cambrian to Middle Ordovician

Marine siliciclastic submarine rocks, including shale, argillite, sandstone with minor volcanic rocks.

Submarine mafic, intermediate and felsic volcanic rocks, including rocks from ophiolite complexes.

GANDER ZONE

Cambrian (?) and Ordovician

Quartzite, psammite, semipelitic and pelitic, including minor black shale, conglomerate, limestone, mafic and felsic volcanic rocks.

AVALON ZONE

Intrusive rocks

Neoproterozoic to Cambrian

Granitoid intrusions, including unseparated mafic phases. Includes Swift Current Intrusive Suite (biotite granite, and diorite and gabbro), and Cape Roger Mountain granite (hornblende-biotite granite).

Mafic intrusions. Includes Cross Hills Intrusive Suite (medium-grained, hornblende-biotite granodiorite and biotite granite, some peralkaline granite), Wandsworth Gabbro (Burin Group) and Grole Intrusive Suite (diorite and gabbro).

Stratified rocks

Neoproterozoic to Middle Cambrian

Shallow marine, mainly fine grained, siliciclastic sedimentary rocks, including minor unseparated limestone and volcanic rocks. Includes Random Formation, Chapel Island Formation.

Neoproterozoic

Fluviatile and shallow marine siliciclastic sedimentary rocks, including minor unseparated limestone and bimodal volcanic rocks (Musgravetown Group).

Bimodal, mainly subaerial volcanic rocks, including unseparated siliciclastic sedimentary rocks (Long Harbour Group and equivalents; Tickle Point Formation and related rocks of the Connaigre Peninsula).

Sandstone and shale turbidites (Musgravetown Group).

Bimodal, submarine to subaerial volcanic rocks, including minor siliciclastic sedimentary rocks (Marystown Group).

Pillow lavas and related mafic volcanic rocks; limestone breccia (Burin Group).

Figure 1. Bedrock geology (modified from Colman-Sadd et al., 1990).

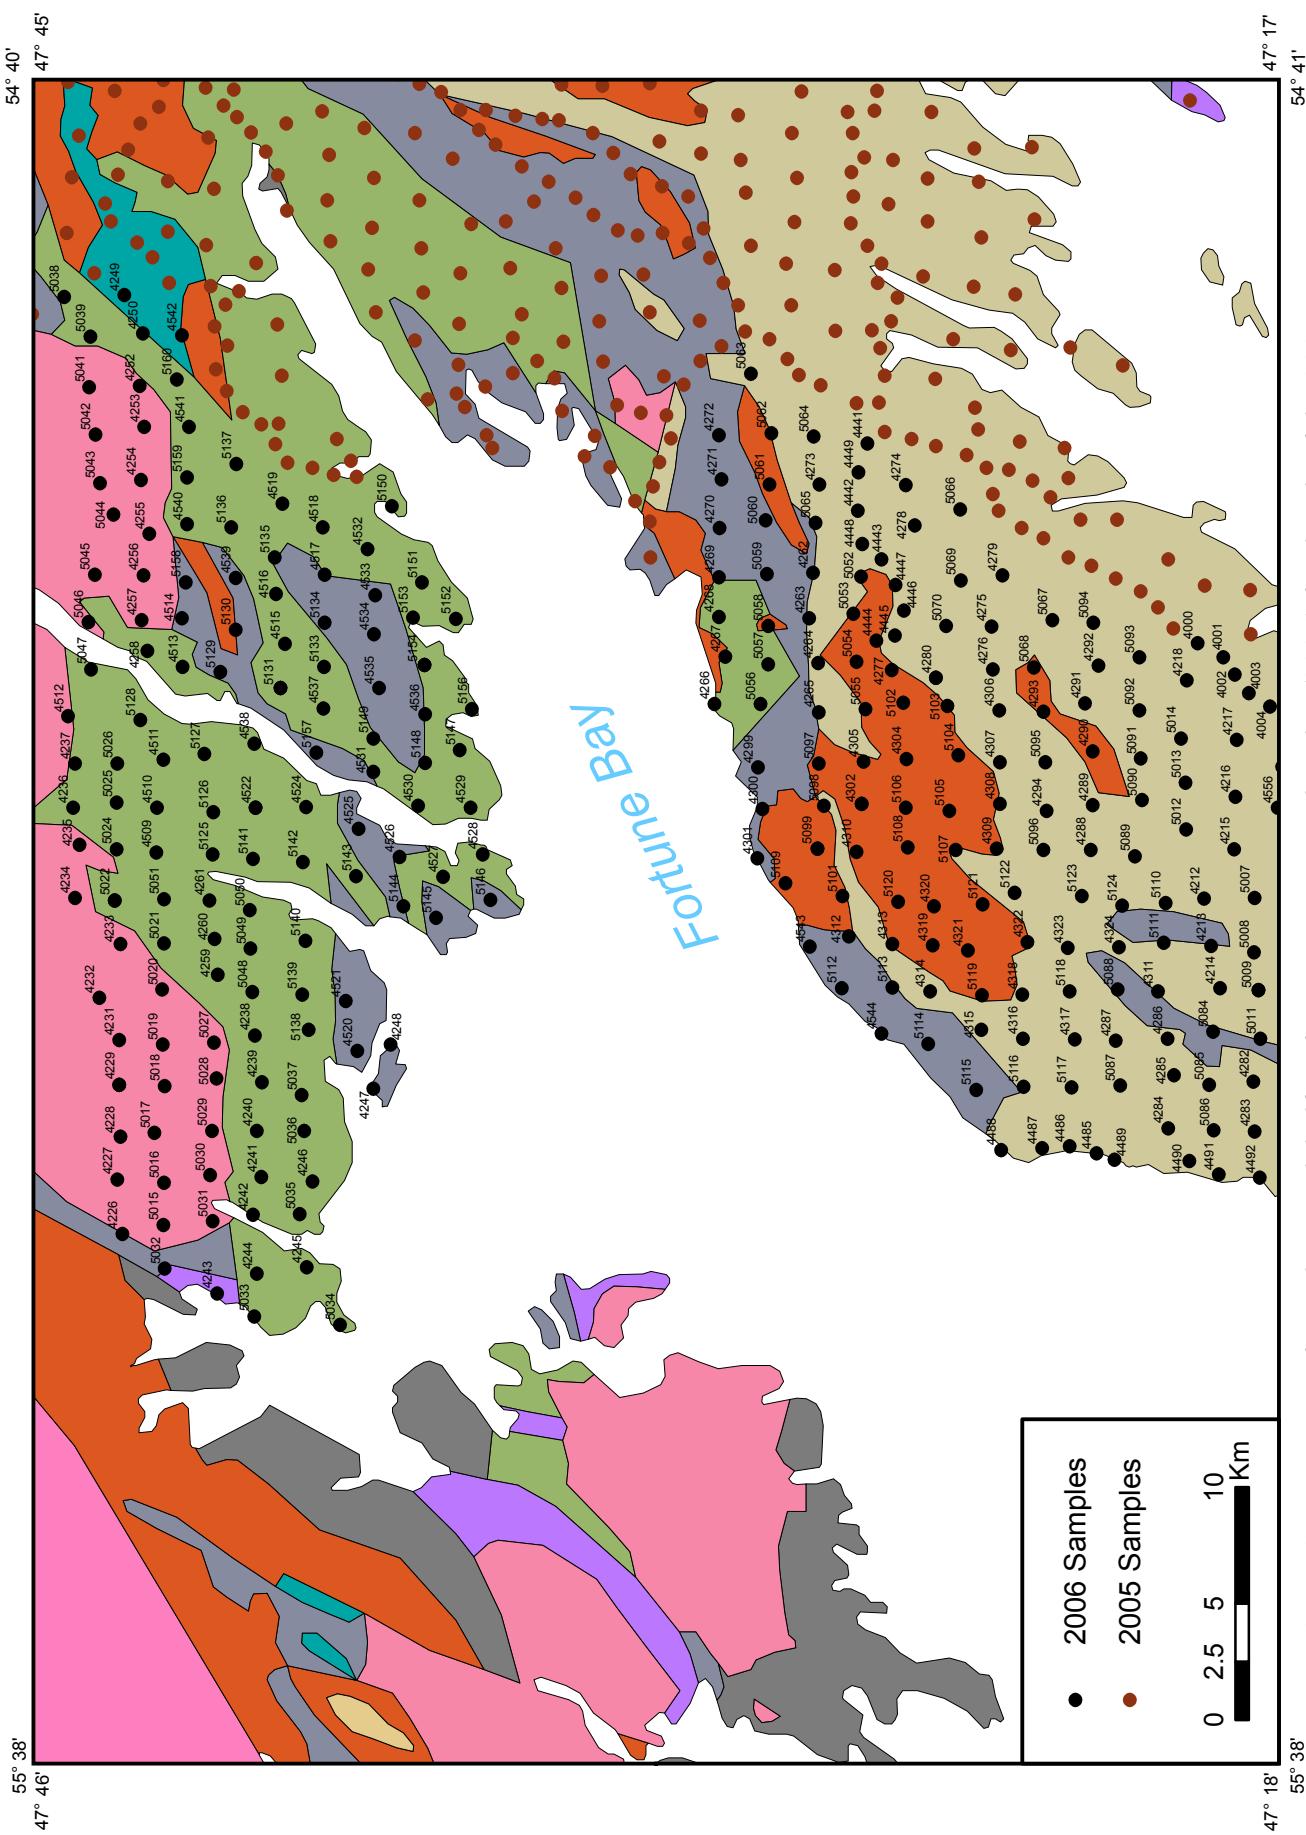

Figure 2a. Location of samples, north half. Refer to Batterson and Taylor (2006) for details of the 2005 survey.

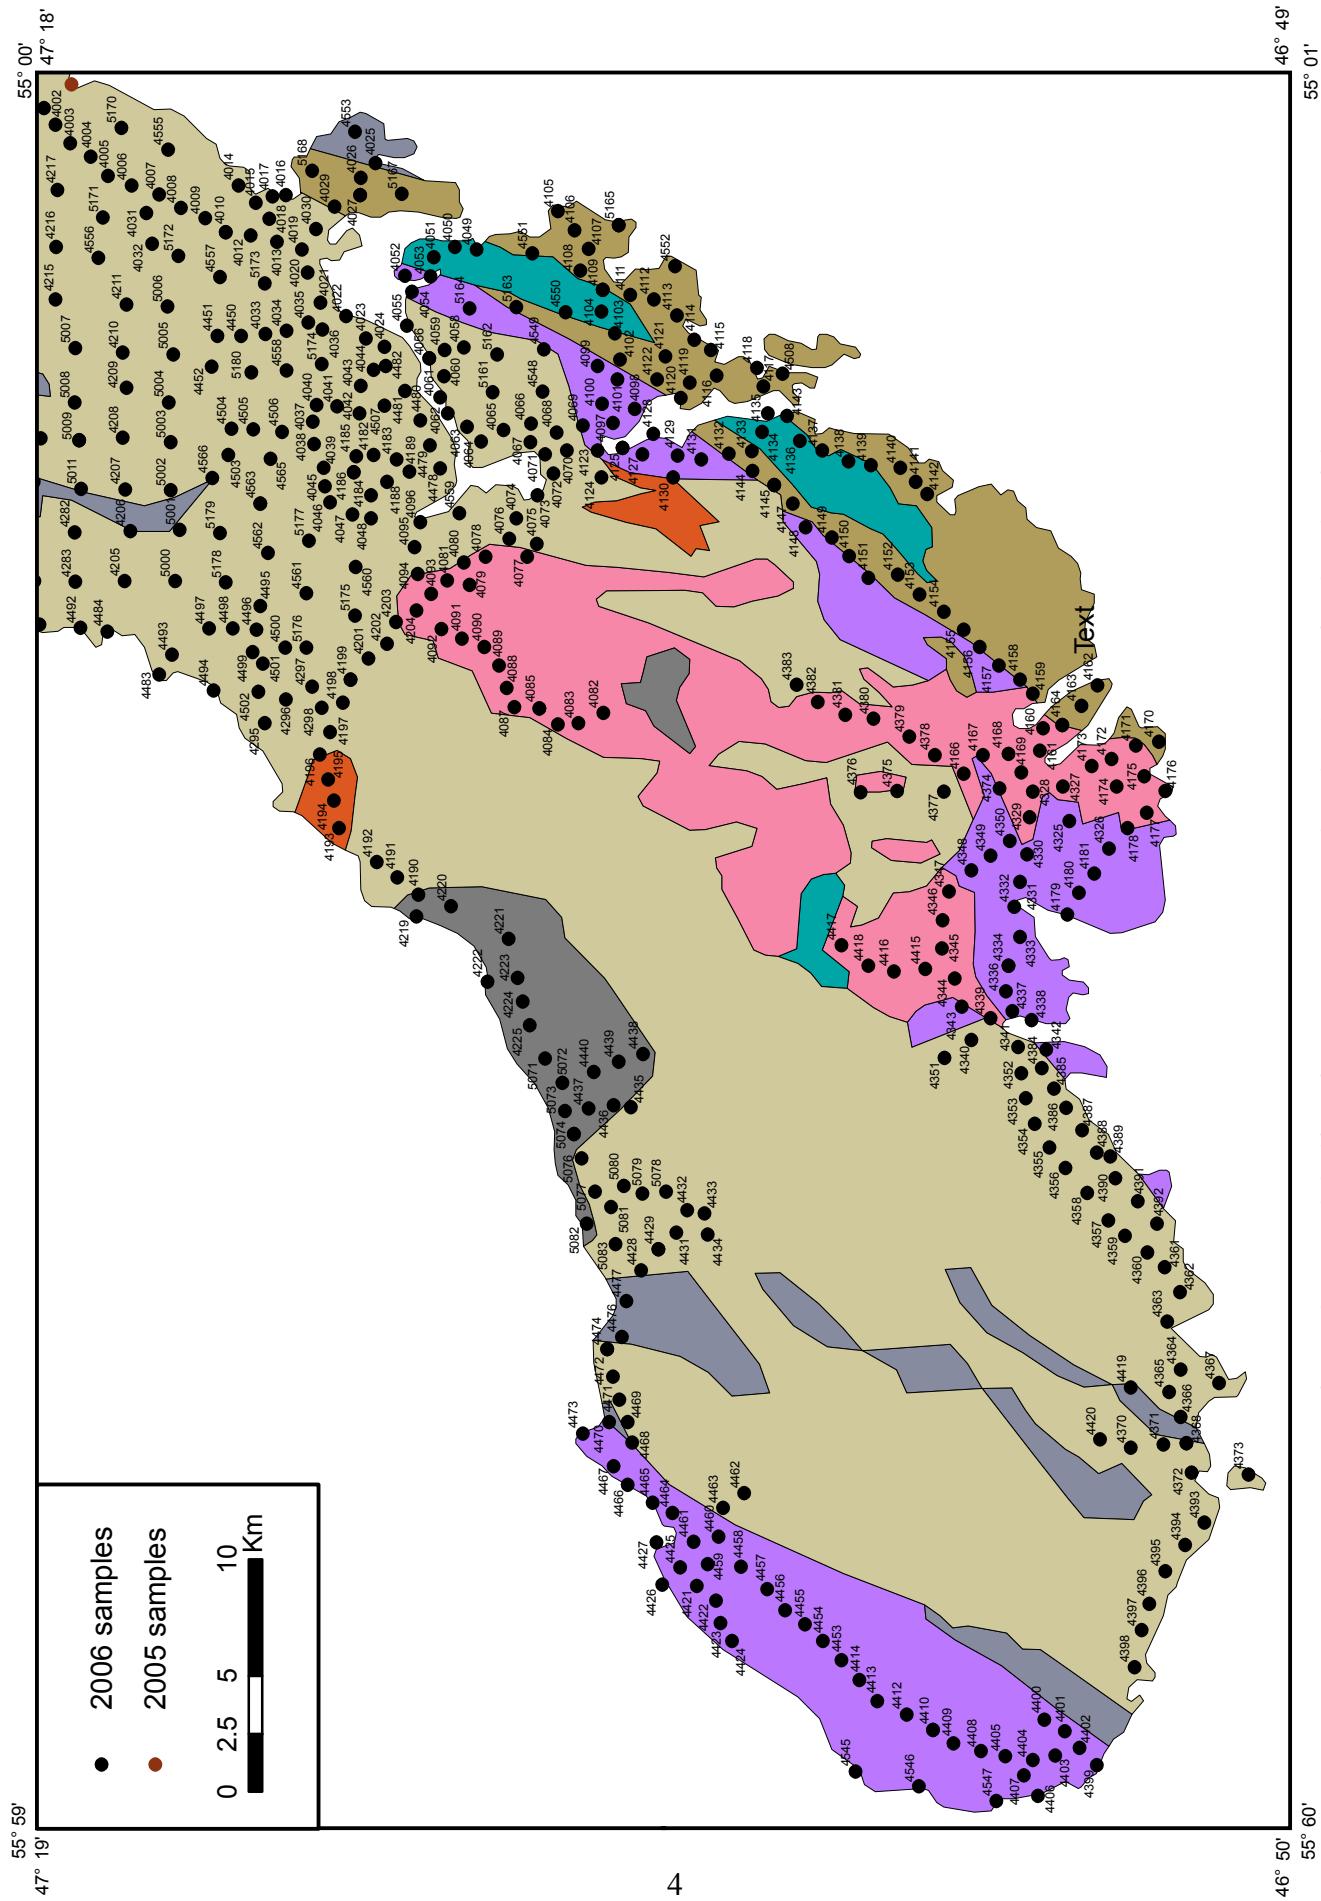

Figure 2b. Location of samples, south half. Refer to Batterson and Taylor (2006) for details of the 2005 survey.

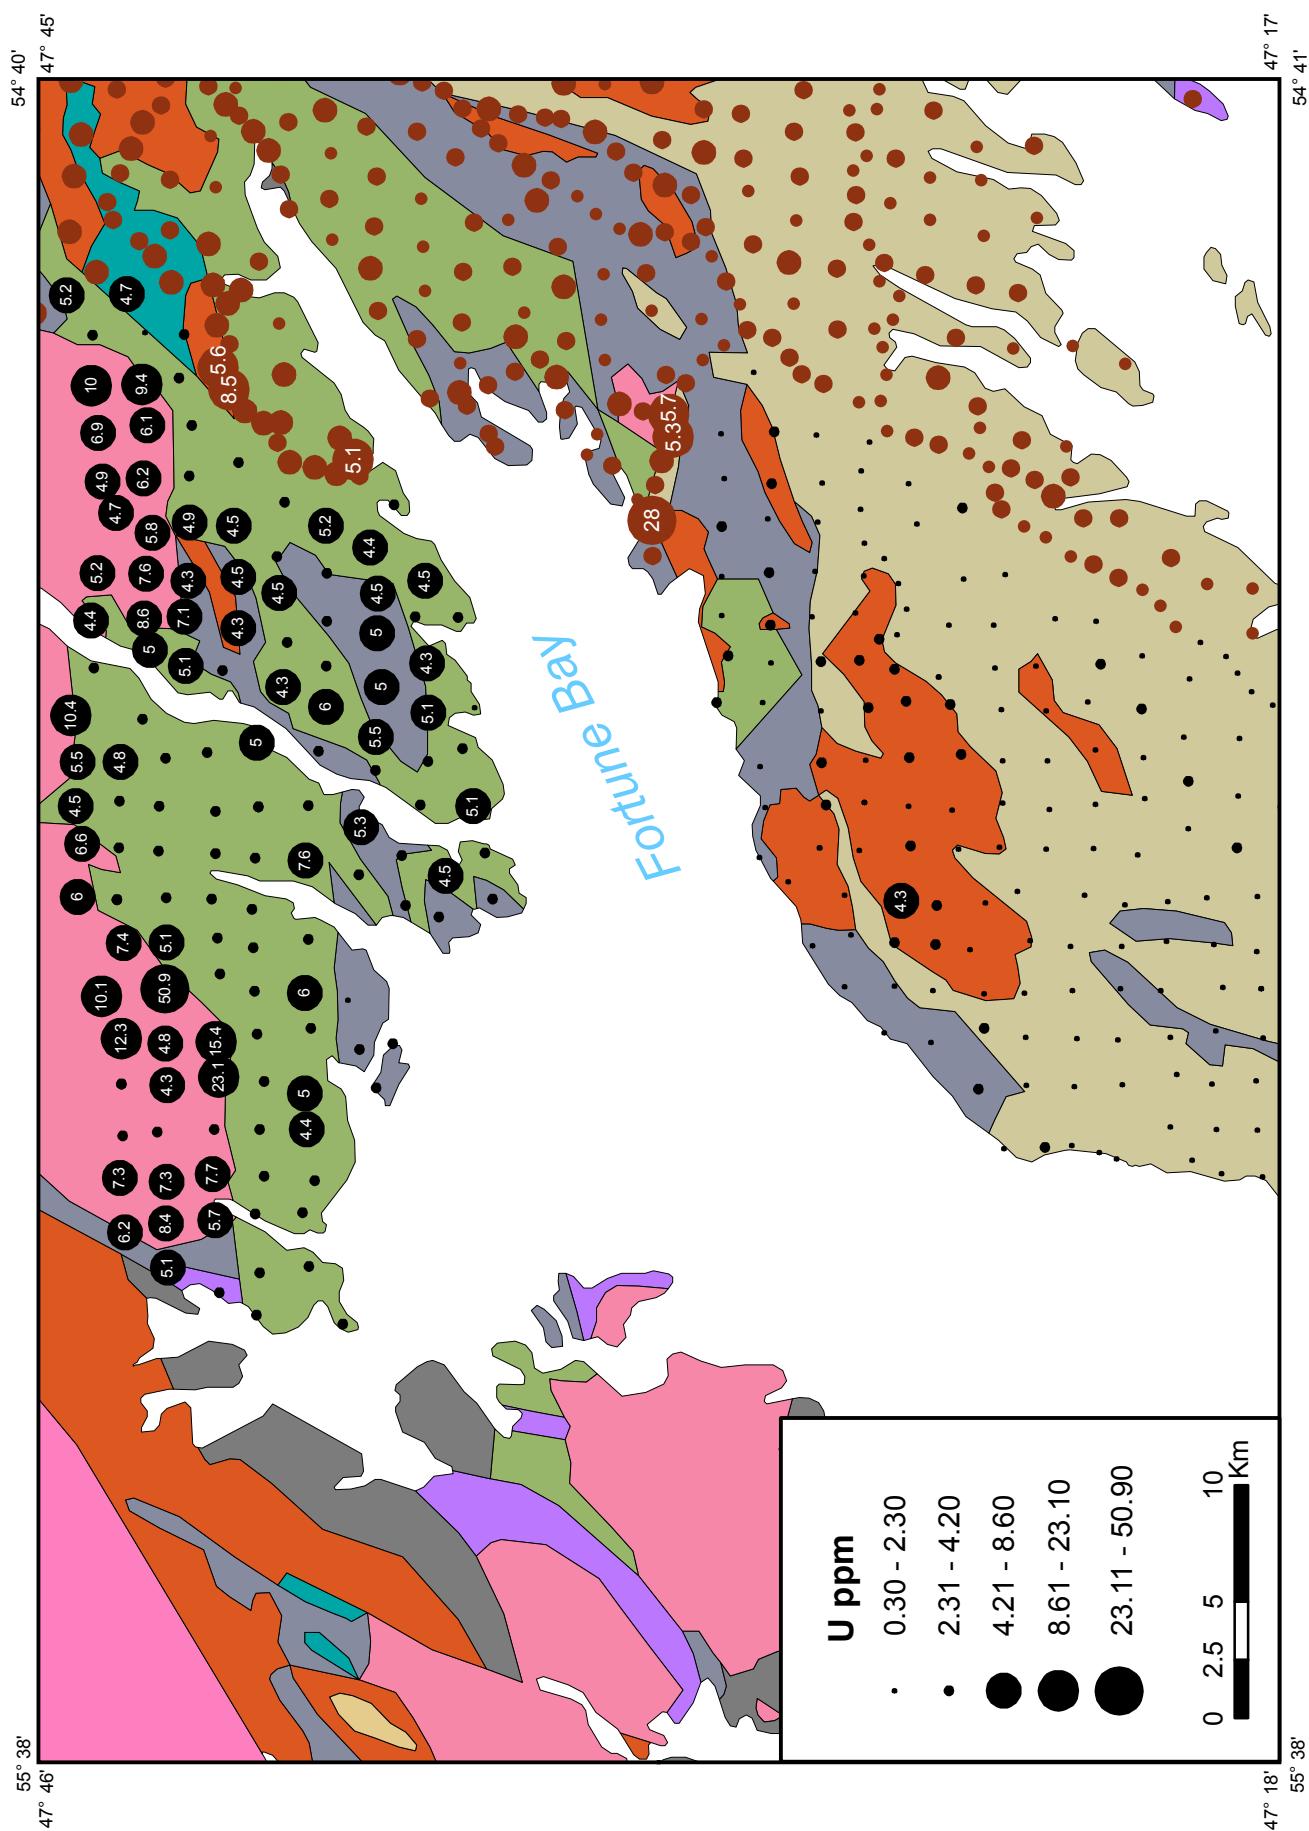

Figure 3a. Distribution of uranium (U) in till, north half. Brown data points are from Batterson and Taylor (2006).

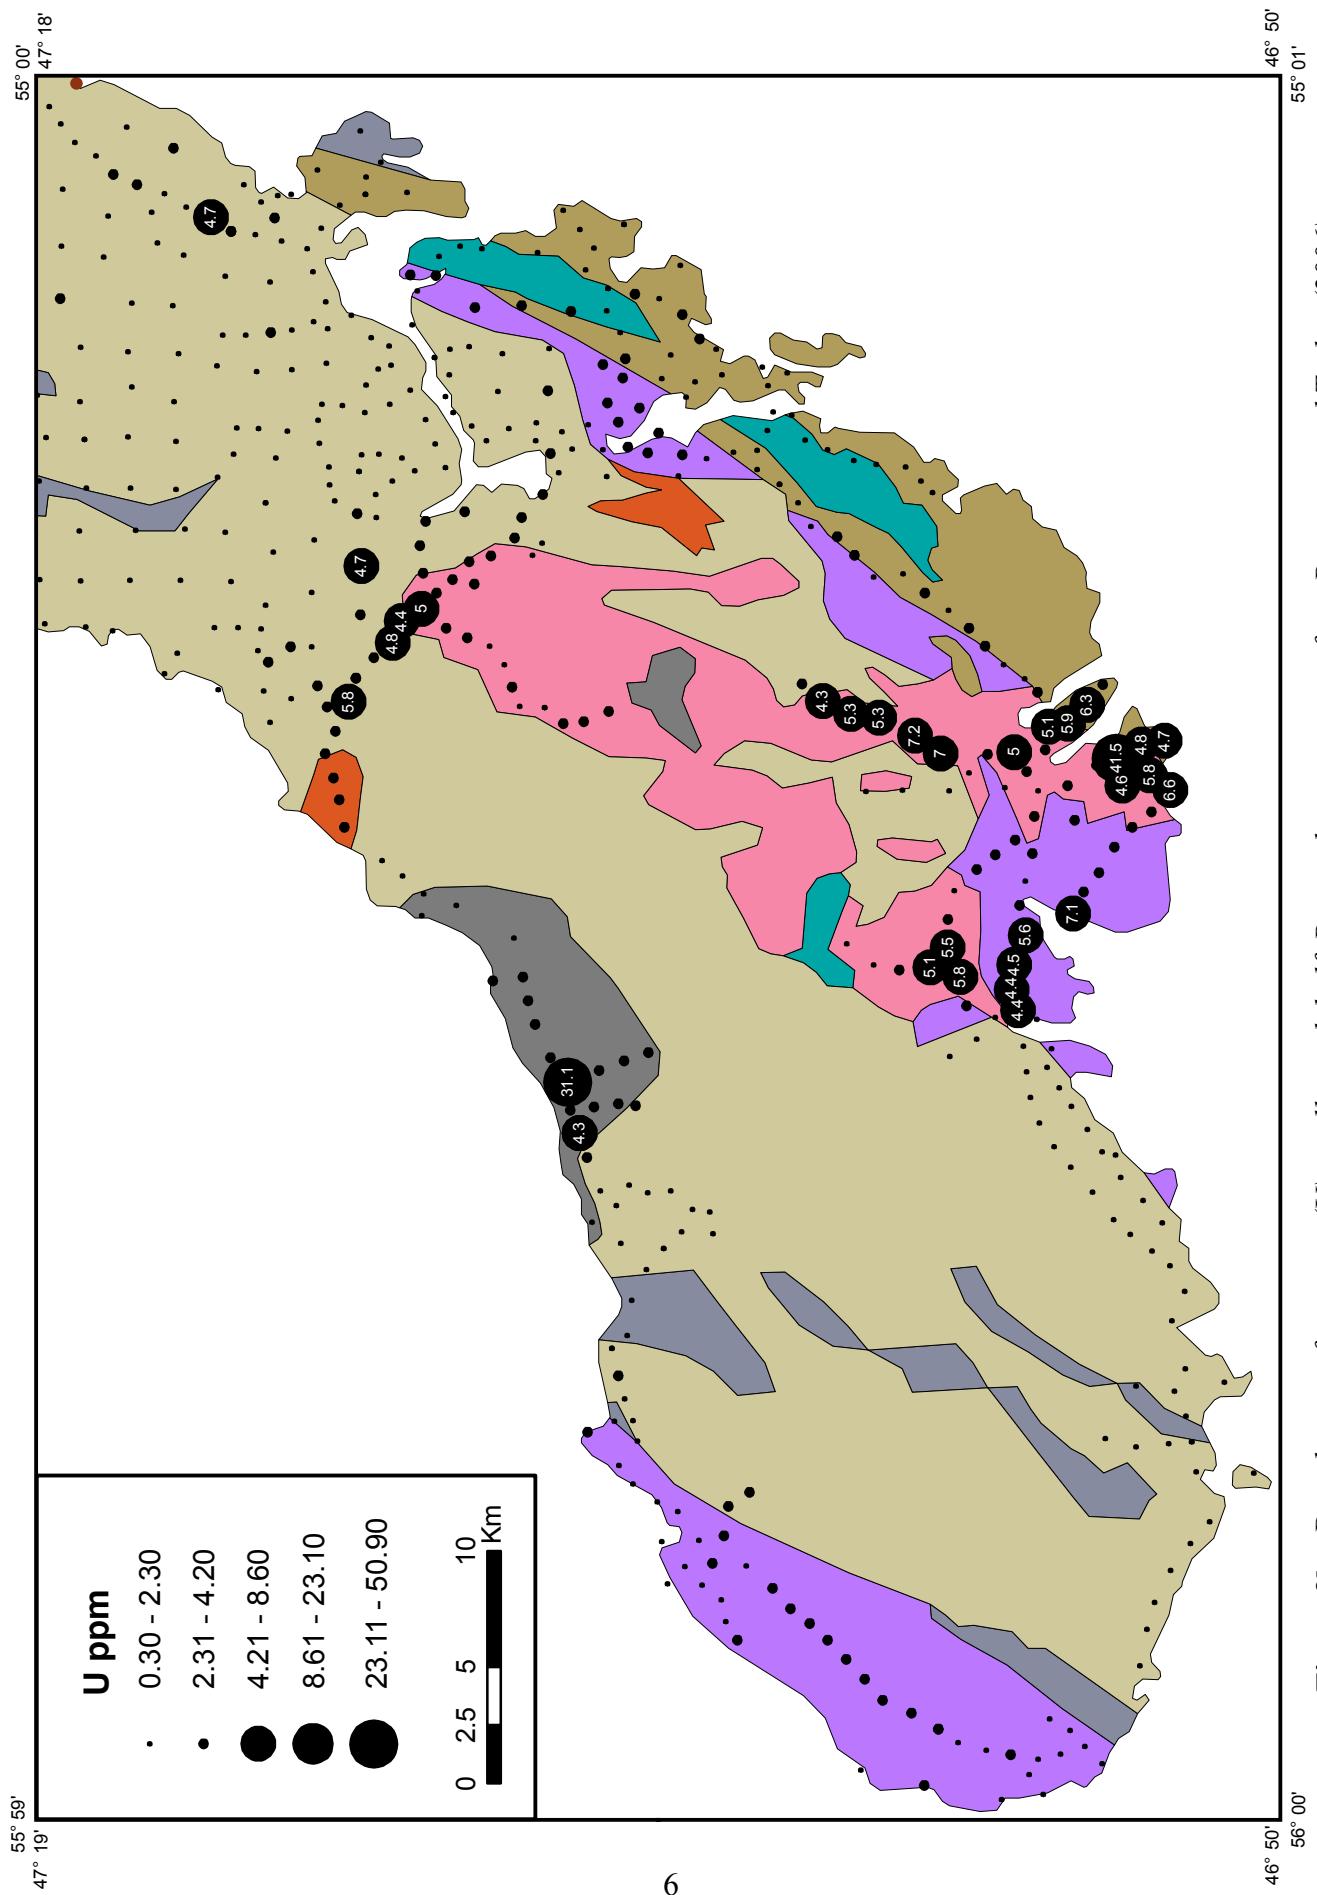

Figure 3b. Distribution of uranium (U) in till, south half. Brown data points are from Batterson and Taylor (2006).

QUALITY CONTROL

Data quality was monitored using laboratory duplicates (analytical precision only). These data are verified at the laboratory and are not included in this report, although they are available upon request. Accuracy estimates are provided by the results from standard reference materials analysed with them. These data show that the uranium results are of high quality.

Data from duplicate samples taken from the same site are presented in Figure 4. They include the duplicates for the entire 2006 survey, and indicate a high level of correlation (0.955).

STATISTICAL ANALYSIS – FREQUENCY DISTRIBUTIONS

The frequency distributions of the geochemical data were examined using the Jenks optimization method, also known as the goodness of variance fit (Jenks, 1967) found within the ArcMap GIS application. The method identifies natural breaks in the dataset, and has replaced the selection of breaks using cumulative frequency plots (c.f., Batterson and Taylor, 2001). Comparison of the two method produced similar subdivisions of the data. Breaks in slope of the curves were used to subdivide the element values into 4-6 natural population groups. These groups are represented by symbols that increase in size with increasing element levels in Figures 3a and b. Statistics (maximum, minimum, median, mean, standard deviation) were generated from the Excel computer application, and are presented in Table 1.

Table 1. Statistics on uranium in till samples from the Burin Peninsula

U1 (ppm)	
Maximum	50.9
Minimum	0.3
Mean	1.9
Median	2.3
Std. Dev.	2.4

ACKNOWLEDGMENTS

We would like to thank the following for their contribution to the project. Gerry Hickey provided his usual high calibre of logistical support for the project. Till sampling was carried out with the excellent assistance of Gord Button and Phil Blundon, and the helicopter skills of Baxter Slade (Newfoundland Helicopters).

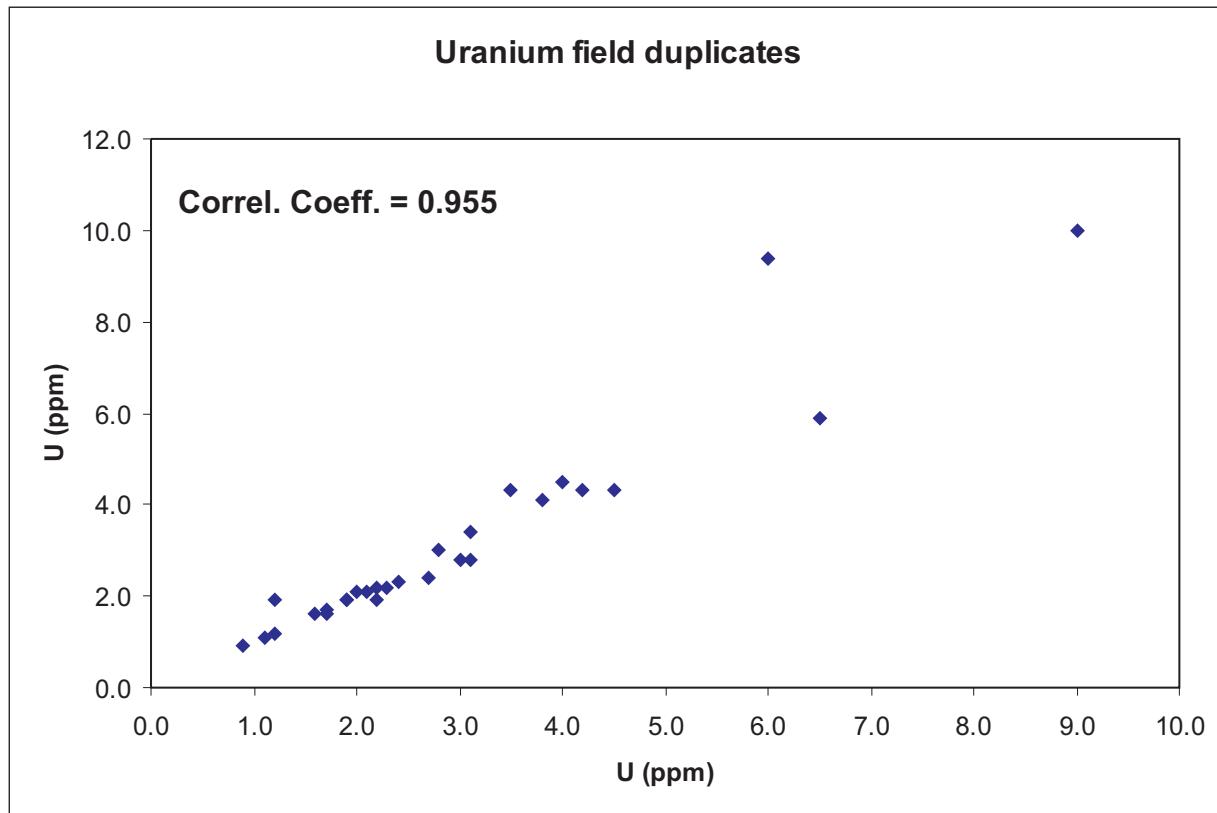

Figure 4. Field duplicate plot for uranium.
